## General experimental details and materials

Materials and Charaterization: All the reagents and solvents were commercially available and used as received. ${ }^{1} \mathrm{H}$ and ${ }^{19} \mathrm{~F}$ were recorded on a $400 \mathrm{MHz} / 600 \mathrm{MHz}$ nuclear magnetic resonance spectrometer operating at 400 and 376 MHz respectively, Chemical shifts were reported relative to $\mathrm{Me}_{4} \mathrm{Si}$ for ${ }^{1} \mathrm{H}$ and $\mathrm{CCl}_{3} \mathrm{~F}$ for ${ }^{19} \mathrm{~F}$. The solvent was either $\mathrm{CDCl}_{3}$ unless otherwise specified. Thermogravimetric analysis (TGA) measurements worked at a heating rate of $10{ }^{\circ} \mathrm{C} \mathrm{min}^{-1}$ with a Netzsch TG-209F3 (Germany) apparatus. Differential scaning calorimetry (DSC) was performed at a scan rate of $5{ }^{\circ} \mathrm{C} \mathrm{min}{ }^{-1}$ on a Shimadzu TA-60WS (Japan) instrument. UV/Vis spectra were recorded with a Shimadzu UV-2700 (Japan) instrument. Fluorescence spectra were recorded with a Hitachi LTD spectrophotometer F-4600. Fluorescence lifetime measurements were executed using a Edinburgh FLS920 spectrofluorometer. X-ray diffraction (XRD) measurement was conducted on a Bruker D8 Advance X-ray diffractometer. The ground-state geometries were optimized by density functional theory (DFT) method with the B3LYP hybrid functional at the basis set level of $6-31 \mathrm{G}^{*}$ in the gas state.

## Synthesis and characterization

The polyfluoroalkyldiols, were reacted with trifluoromethanesulfonic anhydride to give trifluoromethanesulfonate esters ${ }^{1}, 4 \mathrm{~F}, 6 \mathrm{~F}$ and 8 F . Alkyl methyl $p$-toluenesulfonate, $\mathbf{4 H}, \mathbf{6 H}$ and $\mathbf{8 H}$, were prepared by the reaction of corresponding alkyldiols with $p$-toluenesulfonyl chloride. As depicted in Scheme 1, (2-(3,5-dimethoxyphenyl)ethene-1,1,2-triyl)tribenzene, 1, was obtained by Suzuki cross-coupling reaction ${ }^{2}$ in $95 \%$ yield, whereafter, it was transformed into the corresponding phenol ${ }^{3} 2$ in $98 \%$ yield. Two kind of polyfluoroalkyl or alkyl linked macrocycles with two TPE cores (4F-2, 6F-2, 8F-2, 4H-2, 6H-2, 8H-2), and three TPE cores (4F-3, 6F-3, 8F-3, 4H-3, 6H-3, $\mathbf{8 H}-3$ ) were simultaneously obtained in $16 \%-64 \%$ yield via the reaction ${ }^{4}$ of 2 with trifluoromethanesulfonate esters ( $\mathbf{4 F}, \mathbf{6 F}$ and $\mathbf{8 F}$ ) or alkyl methyl ptoluenesulfonate $(\mathbf{4 H}, \mathbf{6 H}$ and $\mathbf{8 H})$ respectively.

## Theoretical calculations of macrocycles

To further understand the electronic structure of macrocycles, the geometry optimization was carried out by density functional theory (DFT) method at B3LYP/6-31G (d) leve ${ }^{5}$ in the gas state. As described in Table 3, the $\Delta E H L$ (HOMO (The highest Occupied Molecular Orbital)-LUMO (The lowest Unoccupied Molecular Orbital) gap, $\Delta \mathrm{E}_{\mathrm{HL}}=\mathrm{E}_{\text {LUмо }}-\mathrm{E}_{\text {Номо }}$ ) value of 6F-2 was larger than that of $\mathbf{6 H}-2$. interestingly, the HOMO of $6 \mathrm{~F}-2$ was distributed over the central double bond of two TPE cores, whereas the corresponding LUMO was mainly localized on the four phenyl groups of one TPE core and the central double bond of the other TPE core, which was different from its alkyl bridged analogue 6H-2.
