Experimental Procedures

Chemicals All reagents and solvents were purchased from commercial sources and used without further purification. HPLC grade methanol was purchased from Fisher Chemical (USA). *O*-Phenylenediamine was obtained from Alfa Aesar, and 2,3-diaminophenazine was obtained from Innochem. Titanium dioxide (P25) was purchased from Degussa Corp. Deionized water (Mill-Q, Millipore, 18.2 MΩ resistivity) was used in all experiments.

Mass spectrometry On-line monitoring was performed on an LTQ XL (Thermo Fisher Scientific, San Jose, CA, USA) instrument using a homemade ionization source of MF-EESI. The operational parameters were as follows: full-scan positive (+) ion spectra were obtained over the m/z range from 100 to 800; the temperature of the MS inlet capillary was 250 °C; the capillary voltage and tube lens voltage were set to 100 V and 120 V, respectively. The maximum ion injection time was 1000 ms. All MS results were obtained and processed using the Xcalibur or Microcal Origin (version 8.0) software.

Other instruments A Quantachrome NOVA 2000e sorption analyzer was used to examine the N₂ adsorption and desorption properties of three kinds of TiO₂ at liquid nitrogen temperature. Powder XRD patterns of all compounds were collected on a Shimadzu XRD-7000 automated diffraction system with Cu K α radiation ($\lambda = 1.5406 \text{ \AA}$). The tube voltage and current were set at 40 kV and 30 mA, respectively. Measurements were made in a 2θ range of 20-40 ° at room temperature with a step of 0.02 °(2θ). The scan speed was 2 degree/min. TEM were performed on a Tecnai G2 F20 transmission electron microscope (FEI Company, Hillsboro, OR, USA) under accelerating voltage of 200 kV. Fluorescence spectra were collected by an FS5 fluorescence spectrophotometer (Edinburgh Instruments, UK). UV-vis absorption spectra were carried out on a UV2450 spectrophotometer (Shimadzu, Japan). The product concentrations were determined by Agilent 7890 GC System with an Agilent 5975 Mass Selective Detector. ¹H NMR spectra was recorded on JEOL-400 spectrometers

General photocatalysis procedure Solutions of *ortho*-arylenediamine (0.9 mM) and DAP (0.1 mM) in water were placed in a quartz double-decker beaker (50 cm³). TiO₂ (1 mg/ml) were added to the beaker. The initial pH value was adjusted to ~5 by NaOH (1M) and HCl (1 M) solution. The mixture was vigorously stirred for 5 min before irradiation. Then, the reaction solution was photoirradiated for 25 min using a 250-W high-pressure mercury lamp (360 nm, from Shanghai Jiguang Special Lighting Appliance Factory) coupled to an additional longpass cut-off filters ($\lambda \geq 450 \text{ nm}$) under continuous magnetic stirring. In the sUVT experiment, the reaction solution was photoirradiated (UV light, 365nm) for 3 min under continuous magnetic stirring. Then additional longpass cut-off filters ($\lambda \geq 450 \text{ nm}$) were used to control irradiation wavelength range during the reaction for 22 min visible light irradiation. After irradiation, the mixture was centrifuged to remove TiO₂ particles for further analysis. The on-line monitoring of MS was carried out under standard conditions. Before the spectrum measurements, TiO₂ was removed by centrifugation of aliquots (0.5 ml), after which the solution was diluted to 3 mL for the measurement.

Computational procedure Quantum chemical calculations were performed using density functional theory (DFT) at the B3LYP¹⁻³/6-311G(d) level with the Gaussian 09⁴ program package. Frequency calculations were performed to confirm all stationary points as local minima or transition states. The transition state was also verified with the intrinsic reaction coordinate (IRC) calculations. Moreover, the solvent effect was evaluated by using the SMD continuum solvent model with water as the solvent. The van der Waals effect was calculated by B3LYP-D using Grimme's D3 method⁶⁻⁷. The corrected Gibbs free energies were used in the energy profiles.

Results and Discussion
