## 1. Materials and Methods

All commercially available compounds, purchased from TCI, Alfa, Energy chemical or Meryer were used without further purification.  $^1\text{H}$  NMR,  $^{13}\text{C}$  NMR spectra were recorded using Bruker AVANCE III HD 600 MHz spectrometer with cryoprobe at the temperatures indicated. NMR solvents were purchased from Cambridge Isotope Laboratories, Inc. Chemical shifts were reported in ppm using the residue solvent peaks: D<sub>2</sub>O  $\delta$  = 4.79 ppm ( $^1\text{H}$  NMR); DMSO- $d_6$   $\delta$  = 2.50 ppm ( $^1\text{H}$  NMR). Data were presented as follows: 1) Chemical shift, 2) multiplicity (s = single, d = doublet, t = triplet, q = quartet, quint = quintet, m = multiple and/or multiple resonances, br = broadened signal, app = apparent splitting pattern), 3) coupling constant (J, in Hz), 4) integration. Positive ion high-resolution mass spectrometry analyses were performed on Bruker micrOTOF II machine.

## 6. Isothermal titration calorimetry (ITC) experiments of cavitand **1b**

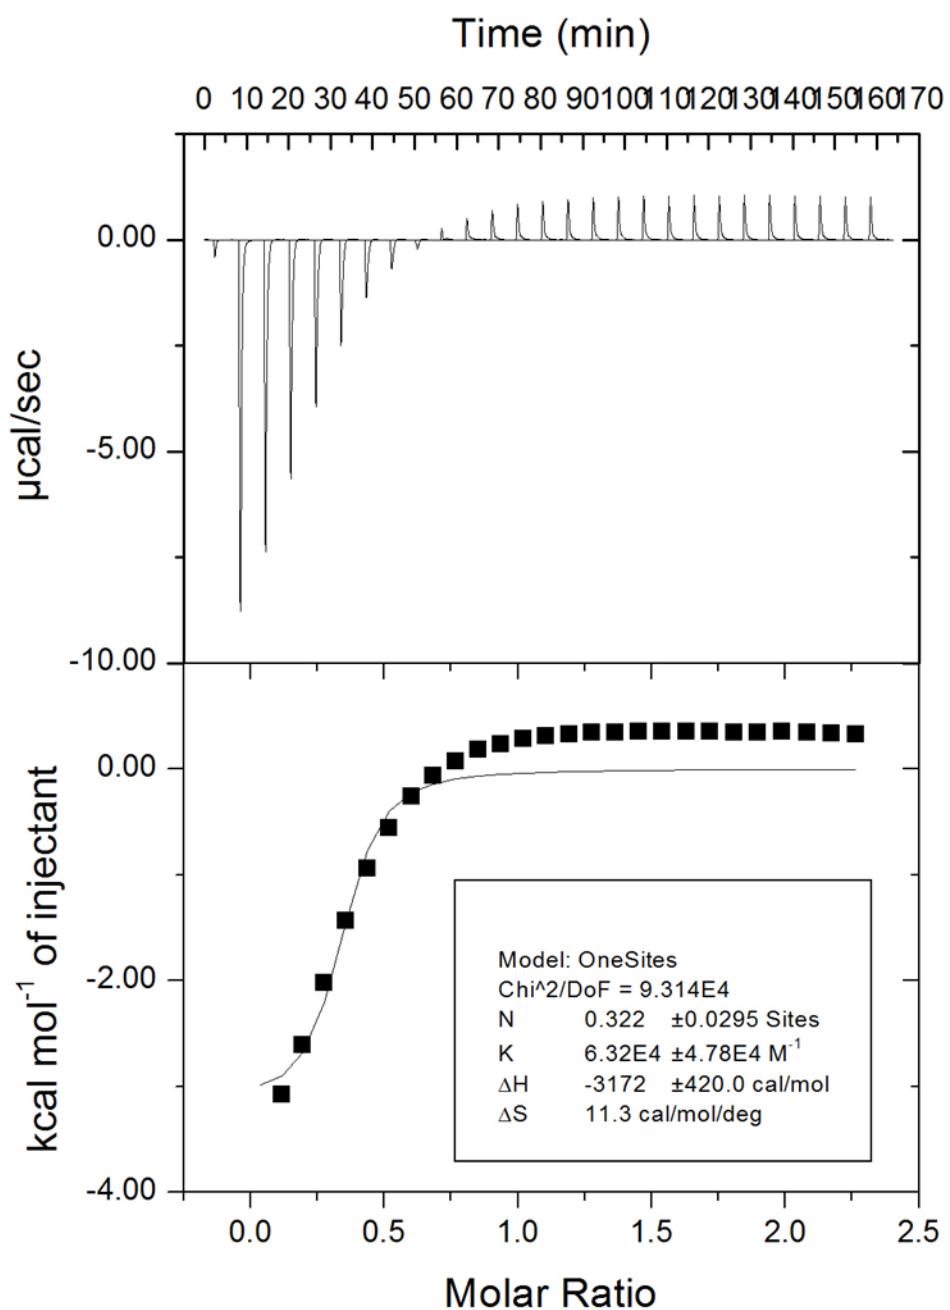

The binding constant was calculated by isothermal titration calorimetry (ITC), using cavitand **1b** as host and different guests (THF, 1,4-dioxane and cyclohexanone). ITC data were obtained on a VP-ITC MicroCalorimeter, MicroCal, LLC (North hampton, MA). Titrations were performed at 25°C with a host concentration of approximately 1 mM in the cell (1.45 mL), and a guest concentration of approximately 10 mM in the syringe. All solutions were prepared with distilled water. Injection volumes varied from 5 to 10 $\mu$ L, with a 360 s spacing between injections. After the reference titration was subtracted, the revised data were fitted to a theoretical titration curve using the One Set of Sites model of the Origin7.0 software provided by MicroCal, LLC.

## 7. Computational details

All calculations were carried out using the B3LYP-D3(BJ) hybrid functional<sup>5</sup> as implemented in the Gaussian 16 software package, revision C.01.<sup>6</sup> The calculations included corrections for dispersion energy using Grimme's D3 dispersion method, coupled with the Becke-Johnson damping function.<sup>7</sup>

Geometry optimizations were performed using the 6-31G(d,p) basis set. The energies of these structures were then corrected for solvation using the SMD model<sup>8</sup> employing the same basis set. The electronic energies were further refined by calculating single-point energies using the 6-311+G(2d,2p) basis set.

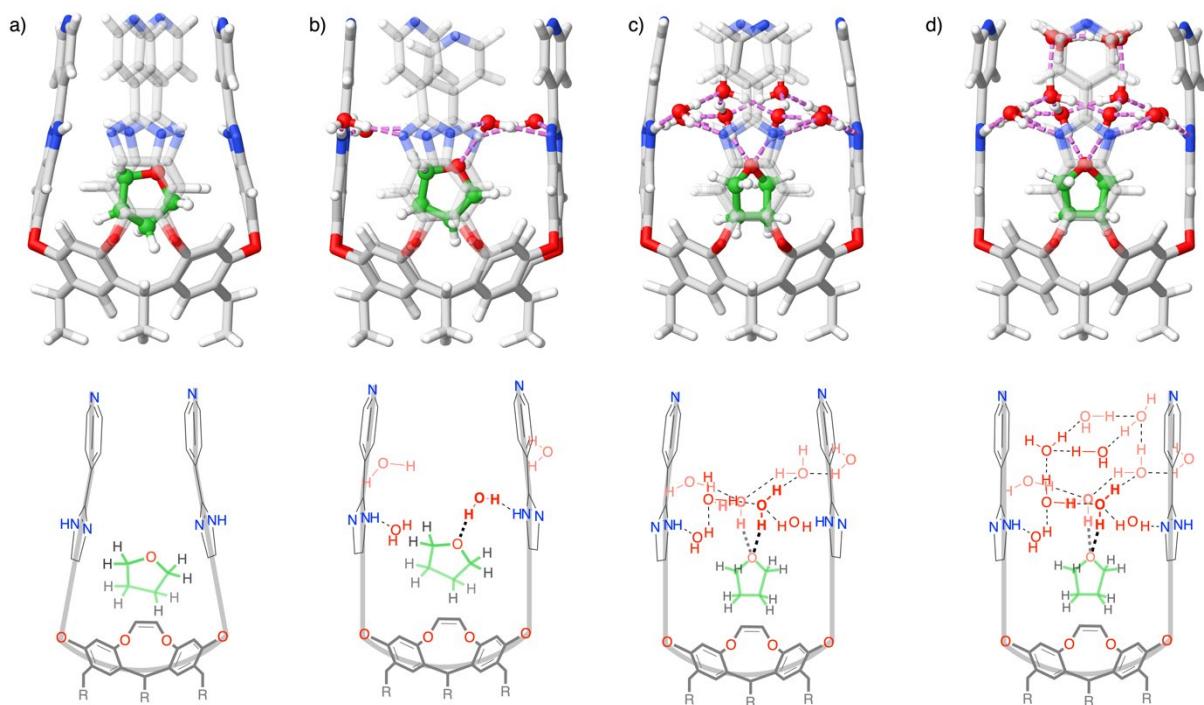

Frequencies were calculated at the same level of theory as the geometry optimizations to ensure that every structure is a minimum without imaginary frequencies and to provide Gibbs free energy corrections. The quasi-rigid-rotor-harmonic-oscillator approach (qRRHO) was then applied to correct the entropic contribution from low-frequency vibrational modes (i.e. smaller than 100 cm<sup>-1</sup>).<sup>9</sup>

In all calculations, the feet of the cavitand were replaced by methyl groups, as has been done in previous studies.<sup>10</sup>

A number of conformations were examined for each host-guest complex in order to obtain the lowest-energy structure, with special attention being given to hydrogen bonding patterns between the guest and solvent molecules, as well as guest orientation inside the cavitand.

## 8. Models with different numbers of water molecules

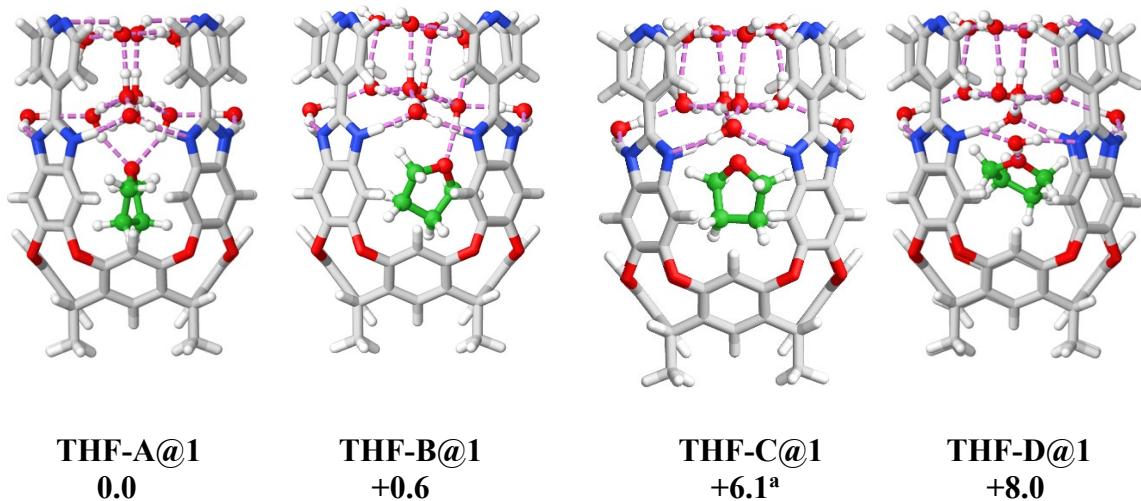

We considered initially host-guest models with different numbers of water molecules (0, 4, 8, or 12) with THF as a representative guest. Geometries with a direct hydrogen bond between THF and the benzimidazole NH donor could not be located in any of the models. As shown in Figure S1, it was found that a total of twelve water molecules, four bridging at the seam and eight inside the cavitand, make a good geometric fit.

**Figure S51.** Models of THF binding in the cavitand considering a) zero, b) four, c) eight, and d) twelve water molecules.

### 8.1. Binding of THF

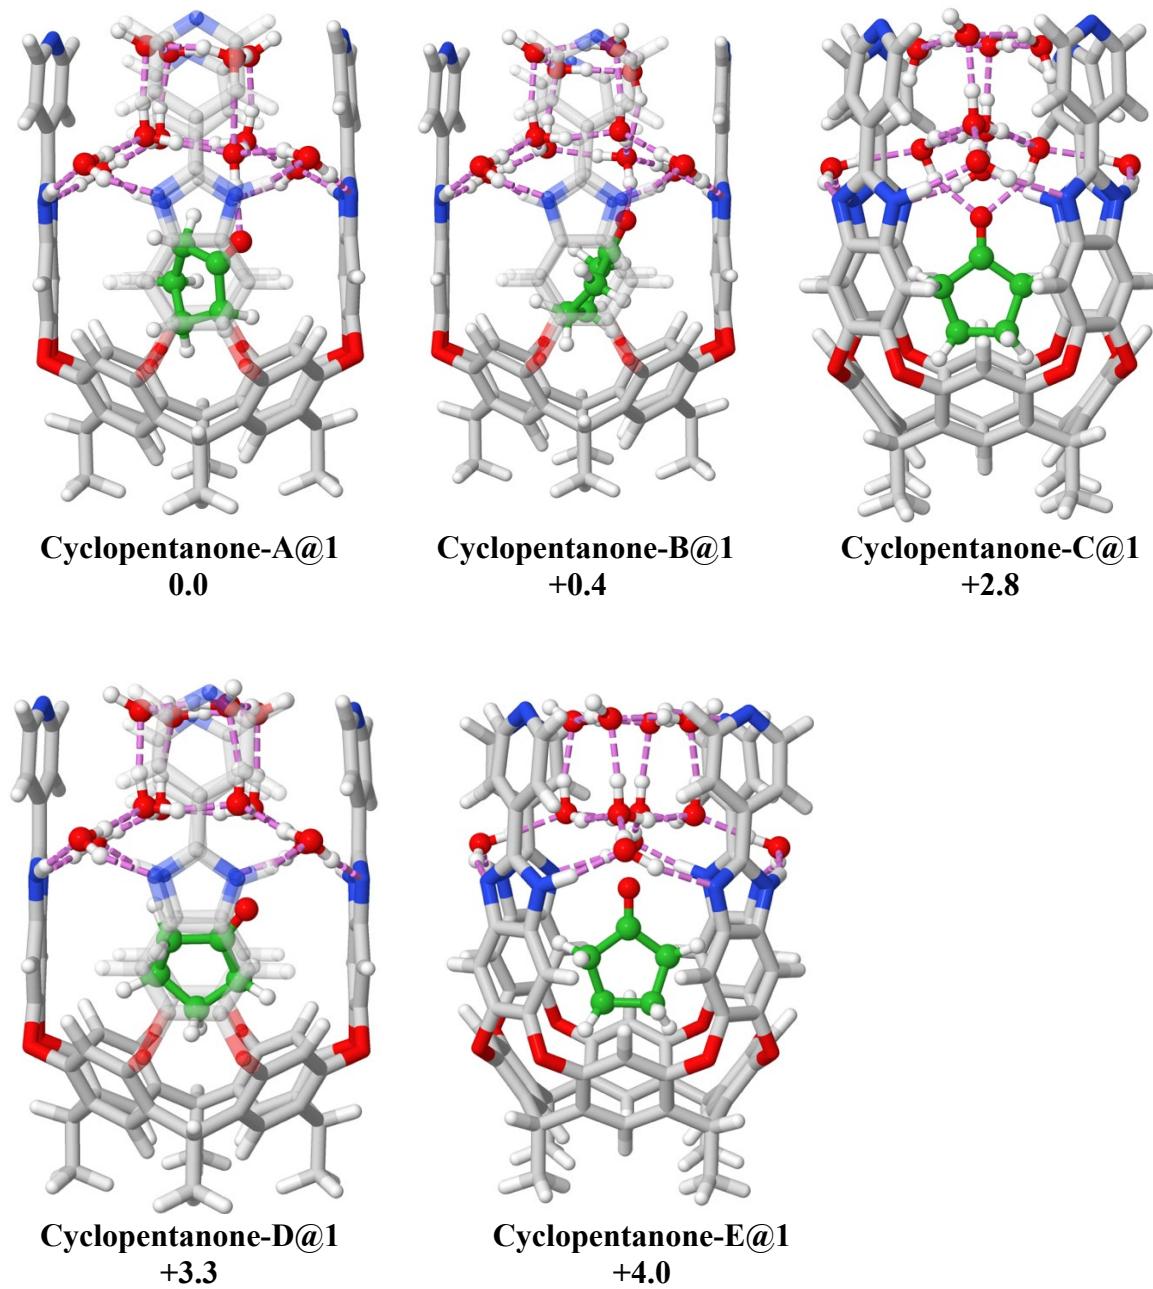

**Figure S52.** Different binding modes of THF in cavitand **1**. Relative energies are indicated in kcal/mol.

<sup>a</sup> A small imaginary frequency ( $6i\text{ cm}^{-1}$ ) was found in the vibrational analysis of this structure. It could not be eliminated despite many attempts to re-optimize the geometry. This imaginary frequency was treated as real in the qRRHO calculations of the thermal corrections to Gibbs free energy.

## 9. Non-covalent interaction plots

The non-covalent interaction (NCI) index enables the identification and classification of non-covalent interactions through a topological analysis of the electron density.[7] The calculations were carried out with NCIPPlot 4.0.1, using promolecular approximation, and cutoff values of 0.5 au for density and 1.0 au for reduced density gradient. The color scale in the figures below is  $-0.04 < \rho < 0.04$  au, where green regions represent weak van der Waals interactions and blue regions represent attractive non-covalent interactions.

In the model without water molecules (Figure S57a), the THF and the cavitand interact through weak dispersion interactions. When water is included in the model (Figure S57b), the oxygen of THF establishes additional favorable hydrogen bonds with a water molecule (blue arrows). The water molecules interact with the cavitand either via hydrogen bonds with the benzimidazoles panels at the seam (Figure S57c, blue arrow), or via van der Waals interactions with the upper parts of the panel (Figure S57c, green arrow).

**Figure S57.** NCI plots for the intermolecular interactions in the host-guest complexes with THF. a) In the absence of water molecules, b) and c) with water molecules present. For clarity, b) shows the intramolecular interactions involving only the guest, while in c) all interactions are presented.
