Computational details

Gaussian 16^{S1} was used to fully optimize all the structures reported in this paper at the M06-2X level of theory.^{S2} For all the calculations, solvent effects were considered using the SMD solvation model^{S3} in dichloromethane. The SDD basis set^{S4} with effective core potential (ECP) was chosen to describe iodine. The 6-31G(d) basis set^{S5} was used for other atoms. This basis set combination will be referred to as BS1. Frequency calculations were carried out at the same level of theory as those for the structural optimization. Transition structures were located using the Berny algorithm. Intrinsic reaction coordinate (IRC) calculations were used to confirm the connectivity between transition structures and minima.^{S6} To further refine the energies obtained from the SMD/M06-2X/SDD,6-31G(d) calculations, we carried out single-point energy calculations using the M06-2X functional method for all of the structures with a larger basis set (BS2). BS2 utilizes the def2-TZVP basis set^{S7} on all atoms. Tight convergence criterion and ultrafine integral grid were also employed to increase the accuracy of the calculations. In this work, the free energy for each species in solution was calculated using the following formula:

$$G = E(\text{BS2}) + G(\text{BS1}) - E(\text{BS1}) + \Delta G^{\text{1atm} \rightarrow 1\text{M}} \quad (1)$$

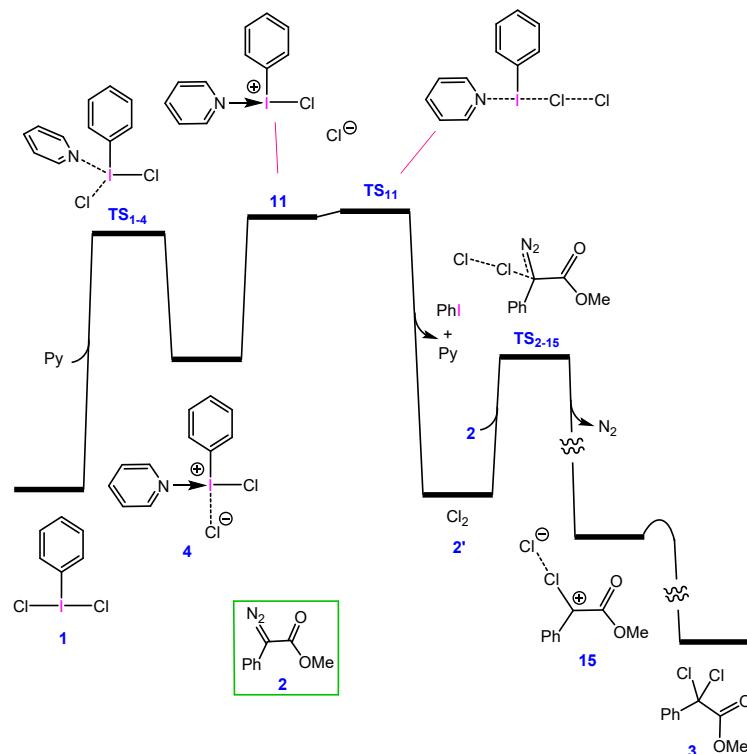

where $\Delta G^{\text{1atm} \rightarrow 1\text{M}} = 1.89 \text{ kcal/mol}$ is the free-energy change for compression of 1 mol of an ideal gas from 1 atm to the 1 M solution phase standard state.

The relative Gibbs energy of **TS₁₋₄** (Fig. S1) is estimated on the basis of the methodology proposed by Hall and Hartwig. In this protocol, for example, the Gibbs free energy barrier for a dissociation reaction such as A-B → A + B is estimated as $\Delta G^\ddagger \approx \Delta H = H_A + H_B - H_{A-B}$.^{S8}

To validate the accuracy of the SMD/M06-2X/def2-TZVP//SMD/M06-2X/SDD,6-31G(d) calculations in determining the relative energies of species, we optimized all structures related to the most favourable pathway for the pyridine-catalysed dichlorination reaction using the triple-zeta def2-TZVP

Ahlrich's basis set and the corresponding ECP for the iodine atom. In addition, the single point calculations using the quadruple-zeta def2-QZVP Ahlrich's basis set and the corresponding ECP for the iodine atom were carried out to refine the energy values for the structures optimized by SMD/M06-2X/SDD,6-31G(d) and SMD/M06-2X/def2-TZVP; the Ahlrich basis sets have been benchmarked for non-covalent interactions (NCI) involving chlorine and reported suitable for mechanistic analysis of such systems;⁵⁹ the NCI analysis for some selected structures confirms the presence of van der Waals interactions in these systems (Figure S2). These additional results demonstrate that basis set dependence is insignificant (Table S1). For example, using SMD/M06-2X/def2-TZVP//SMD/M06-2X/SDD,6-31G(d), the relative free energies of **TS₁₋₄**, **4**, **11**, and **TS₁₁** are 22.8, 11.1, 23.8, and 23.9 kcal/mol, respectively. Using SMD/M06-2X/def2-QZVP//SMD/M06-2X/def2-TZVP, the relative free energies are 24.5, 11.8, 22.3, and 23.2 kcal/mol, respectively. It follows from these results that the methodology used for studying the title reaction is adequately reliable.

NCI analysis. To evaluate whether a weak noncovalent interaction exists between two chlorine atoms in our systems, we performed NCI analysis for structures **15**, **TS₂₋₁₅**, and **TS₁₁** using the Multiwfn 3.7 package.^{S10} This method is used for distinguishing hydrogen bonds, van der Waals interactions and repulsive steric clashes^{S11} and has been reported as a powerful tool for assessing the characteristic of halogen bonds.^{S12} Plot of the reduced density gradient versus $\text{sign}(\lambda_2).\rho$ for these selected structures are shown in Figure S2. An attractive interaction is identified between two chlorine atoms in **15**, confirmed by one spike with a negative λ_2 . This result indicates the presence of a halogen bond between the two chlorine atoms in this molecule. For structure **TS₂₋₁₅**, no noncovalent interaction between two chlorines is detected by means of the NCI analysis. This is because, in this transition structure, a significant covalent bonding interaction still exists between the two chlorine atoms, a claim that finds support from Wiberg bond index (WBI) analysis showing a WBI value of 0.637 for this bond (Fig. S2a). In contrast, due to the early character of transition structure **TS₁₁**, there is a negligible covalent bonding between two chlorines in this structure, supported by a small WBI value of 0.02 (Fig. S2c). As a result, we identified an attractive noncovalent weak interaction midway between the two chlorine atoms in **TS₁₁** within the NCI framework.

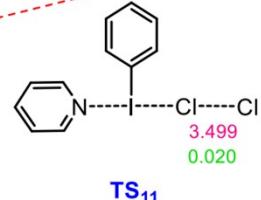

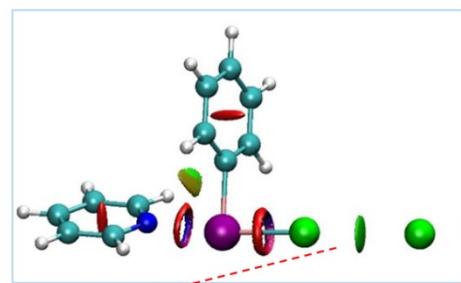

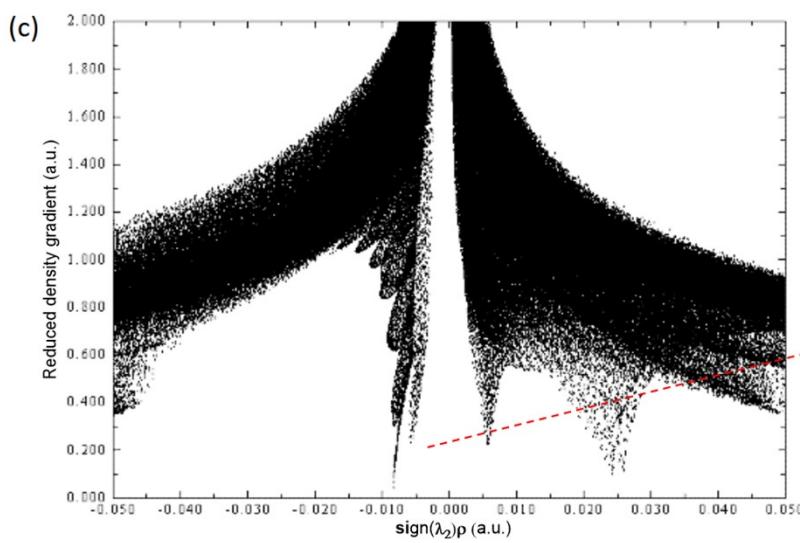

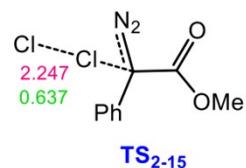

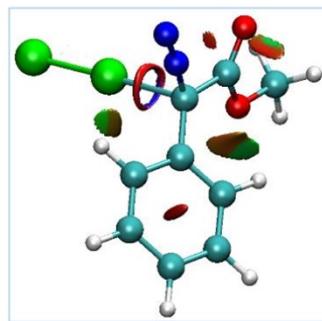

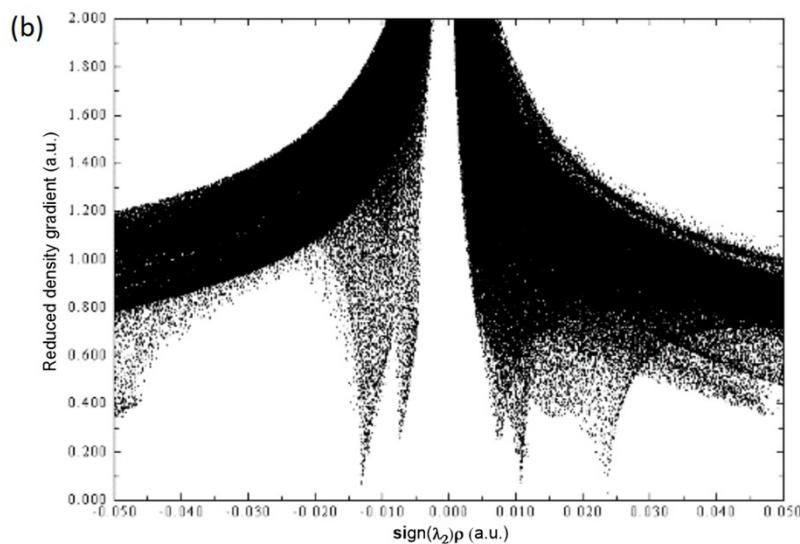

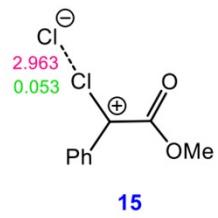

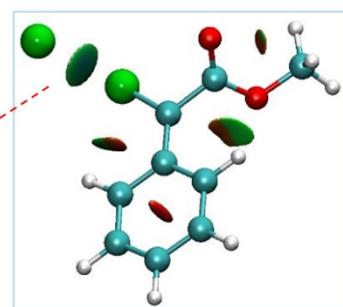

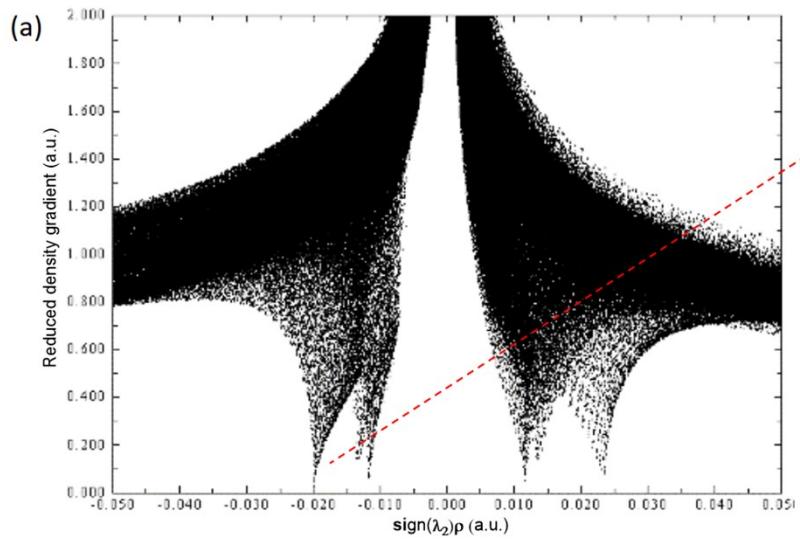

Fig. S2. NCI analysis for **TS₁₁**, **TS₂₋₁₅** and **15** calculated at the SMD/M06-2X/def2-TZVP//SMD/M06-2X/6-31G(d),SDD level of theory in dichloromethane. The Cl-Cl distances (Å) and the WBI values between two chlorine atoms are annotated in pink and green, respectively.
