1 General Methods

NMR spectra were recorded at 301 K on Bruker Avance-300 MHz, Bruker 400 Avance III BBI-z grad 5 mm Bruker 600 Avance Neo spectrometer. All the ^1H -NMR spectra were referenced to residual isotopic impurity of CDCl_3 (7.26 ppm), $\text{DMSO-}d_6$ (2.50 ppm) or CD_3CN (1.98 ppm). ^{13}C -NMR spectra were referenced to the CDCl_3 peak (77.0 ppm) or CD_3CN peak (1.32 ppm).

The following abbreviations are used in reporting the multiplicity for NMR resonances; s=single, d=doublet, t= triplet, and m=multiplet. The NMR data were processed using Bruker Topspin 3.5 pl2 and MestReNova 12.0.0.

ESI-MS spectra have been acquired with an Agilent Technology LC/MSD Trap SL, interfaced to an Agilent 1100 binary pump. MS peak intensity for each analysis is reported as monoisotopic mass.

High resolution electrospray ionization mass spectrometry HRMS (ESI-TOF) analyses were performed in positive mode with Waters Xevo G2-S QTof. The analysis was performed with Fast Flow Injection: 10 μl of sample injected ACN at 30 $\mu\text{l}/\text{min}$. Capillary: 3000V, Sample cone: 30V, Source temperature: 80C, Desolvation temperature: 250 $^\circ\text{C}$.

Chemicals were purchased from Sigma Aldrich, TCI, or Apollo Scientific and used without further purification.

ECD spectra were recorded with a Jasco J-1500 spectrometer and processed with OriginPro 2018 (64-bit) SR1 b9.5.1.195.

HPLC analysis were performed on a Shimadzu HPLC equipped with a Eurospher II 100-5 C18 (5 μm , 4.6 x 250 mm) column. The water, used for both solvent and diluent, was HPLC-grade. For buffering the mobile phase and adjusting the pH to 2.4, both monobasic potassium phosphate and phosphoric acid were used.

2 Synthesis and Characterization

2.1 Synthesis of 1-(5-bromopyridin-2-yl)ethan-1-ol (4)

In a 250 mL double necked flask, 5-bromo-2-pyridinecarboxaldehyde **3** (10.00 g, 53.7 mmol) was dissolved in dry THF (180 mL) under N_2 and cooled to $0\text{ }^\circ\text{C}$. Methylmagnesium bromide (1.4 M in toluene/THF (3:1), 45.9 mL, 64.2 mmol) was added dropwise under stirring. After 2 hours, the reaction mixture was diluted with EtOAc, washed with potassium phosphate buffer (1 M, pH 7), dried over MgSO_4 and the solvent was removed under reduced pressure. The crude product **4** was obtained as a brownish oil and used in the next step without further purifications (10.26 g, 50.8 mmol, 95%).

^1H NMR (300 MHz, CDCl_3) δ (ppm): 8.59 (d, $J = 2.0$ Hz, 1H), 7.80 (dd, $J = 8.4, 2.3$ Hz, 1H), 7.24 (d, $J = 8.4$ Hz, 1H), 4.86 (q, $J = 6.4$ Hz, 1H), 3.73 (s, 1H), 1.48 (d, $J = 6.5$ Hz, 2H).

ESI-MS (m/z): $[\text{M}+\text{H}]^+$ calcd. for $[\text{C}_7\text{H}_8\text{BrNO}+\text{H}]^+$, 202.00, found 201.93

2.2 Synthesis of 1-(5-bromopyridin-2-yl)ethyl 4-methylbenzenesulfonate (5)

In a 250 mL flask, to a stirred solution of alcohol **4** (9.17 g, 45.4 mmol) and DMAP (11.09 g, 90.8 mmol) in CH_2Cl_2 (180 mL) *p*-toluenesulfonyl chloride (10.33 g, 54.2 mmol) was added at $0\text{ }^\circ\text{C}$. The mixture was stirred for 10 min at the same temperature and then overnight at room temperature. After 12 hours, ice water was added to the reaction mixture and the mixture was extracted with CH_2Cl_2 . The organic layer was washed with water and brine, dried over MgSO_4 and the solvent was removed under reduced pressure. The brownish oil was dissolved in CH_2Cl_2 , and few milliliters of EtOH were added. The mixture was put in the fridge and after 24 h the pure product **5** was obtained as a pale brown crystalline solid that was washed with few milliliter of ice-cooled EtOH (8.10 g, 50 %).

^1H NMR (300 MHz, CDCl_3) δ (ppm): 8.50 (d, $J = 2.4$ Hz, 1H), 7.72 (dd, $J = 8.3, 6.4$ Hz, 4H), 7.29 – 7.20 (m, 4H), 5.55 (q, $J = 6.6$ Hz, 1H), 2.41 (s, 4H), 1.56 (d, $J = 6.6, 3\text{H}$).

^{13}C NMR (75 MHz, CDCl_3) δ (ppm): 157.35, 150.21, 144.94, 139.53, 133.95, 129.87, 127.99, 122.12, 120.21, 80.13, 21.76.

2.3 Synthesis of 2-(1-azidoethyl)-5-bromopyridine (6)

In a 250 mL flask, a mixture of tosylate **5** (6.95 g, 19.5 mmol) and sodium azide (5.07 g, 78.0 mmol) was stirred in DMSO (100 mL) at room temperature overnight. After the reaction was complete the mixture was diluted with 150 mL of 30% EtOAc in hexane and washed with water and brine. The organic layer was dried over MgSO_4 and the solvent was removed under reduced pressure. The pure product **6** was obtained as a yellow oil (4.28 g, 97%).

^1H NMR (300 MHz, CDCl_3) δ (ppm): 8.62 (d, $J = 2.4$ Hz, 1H), 7.82 (dd, $J = 8.3, 2.4$ Hz, 1H), 7.32 – 7.14 (m, 1H), 4.62 (q, $J = 6.9$ Hz, 1H), 1.57 (d, $J = 6.9$ Hz, 3H).

^{13}C NMR (75 MHz, CDCl_3) δ (ppm): 158.81, 150.62, 139.77, 122.06, 119.95, 61.10, 20.15.

FT-IR (CH_2Cl_2) ν (cm^{-1}): 2985, 2923, 2094, 1578, 1463.

ESI-MS (m/z): $[\text{M}+\text{H}]^+$ calcd. for $[\text{C}_7\text{H}_7\text{BrN}_4+\text{H}]^+$, 227.00, found 226.94.

2.4 Synthesis of 1-(5-bromopyridin-2-yl)ethan-1-amine (7)

In a 500 mL flask, a mixture of azide **6** (4.28g, 18.8 mmol), triphenylphosphine (9.89 g, 37.7 mmol), and water (0.68 mL, 37.7 mmol), was stirred in THF at room temperature for 48 hours. After that, water (0.68 mL, 37.7 mmol) was added and the reaction mixture was stirred for 24 hours. The mixture was condensed under reduced pressure and the residual brown oil was distilled using a K \ddot{u} gelrohr apparatus, yielding the pure product **7** as a pale yellow oil (3.6 g, 95%) (bp 130 $^\circ\text{C}$ /0.1 mm Hg).

^1H NMR (300 MHz, CDCl_3) δ (ppm): 8.59 (d, $J = 2.4$ Hz, 1H), 7.76 (dd, $J = 8.2, 2.3$ Hz, 1H), 7.23 (d, $J = 8.4$ Hz, 1H), 4.13 (q, $J = 6.7$ Hz, 1H), 1.88 (s, 3H), 1.40 (d, $J = 6.6$ Hz, 3H).

^{13}C NMR (75 MHz, CDCl_3) δ (ppm): 164.41, 150.31, 139.28, 121.65, 118.70, 52.18, 24.53.

FT-IR (CH_2Cl_2) ν (cm^{-1}): 3350, 3591, 2976, 2931, 1587, 1463, 1365.

ESI-MS (m/z): $[\text{M}+\text{H}]^+$ calcd. for $[\text{C}_7\text{H}_9\text{BrN}_2+\text{H}]^+$, 201.00, found 200.95

2.5 Synthesis of *R*-(+)-1-(5-bromopyridin-2-yl)ethan-1-amine ((*R*)-7)

In a Schlenk apparatus, racemic 1-(5-bromopyridin-2-yl)ethan-1-amine **7** (4.10 g, 12.6 mmol) and D-(-)-tartaric acid (3.50 g, 23.3 mmol) were dissolved in 2 mL of boiling water. Then 10 mL of boiling EtOH were added to the mixture. The solution was cooled to room temperature. After 24 hours, a white crystalline precipitate was observed. The supernatant was removed and the crystals washed with few milliliters of EtOH and Et₂O. Four recrystallizations of this precipitate from 8 mL of 95% EtOH gave the (-)-acid tartrate salt of *R*-(+)-amine (>99% e.e.). The salt was dissolved in 50 mL of 2 M NaOH and the solution was extracted with Et₂O. The organic layer was dried with MgSO₄ and concentrated under reduced pressure. The pure product (*R*)-**7** was obtained as a pale yellow oil (0.85 g, 41%). The enantiomeric excess of (*R*)-**7** has been reported via NMR using a reported procedure.¹

2.6 Synthesis of *R*-(+)-1-(5-bromopyridin-2-yl)-*N,N*-bis((5-bromopyridin-2-yl)methyl)ethan-1-amine ((*R*)-8)

In a Schlenk apparatus, (*R*)-**7** (0.40 g, 2.2 mmol) and 5-bromo-2-pyridinecarboxaldehyde **3** (0.41 g, 2.2 mol) were dissolved in 15 mL of dry CH₂Cl₂ under N₂, and left under stirring for 1 hour. Three aliquots of NaBH(OAc)₃ (0.15 g, 0.73 mmol) were added waiting 20 minutes between each addition. After that, 5-bromo-2-pyridinecarboxaldehyde **3** (0.41 g, 2.2 mol) was added and the mixture was left under stirring for 1 hour. Three aliquots of NaBH(OAc)₃ (0.15 g, 0.73 mmol) were added waiting 20 minutes between each addition. After the reaction mixture was stirred for 12 hours at room temperature. The solvent was removed under reduced pressure. The resulting brown oil was dissolved in EtOAc and the solution extracted with 0.1 M solution of KOH (3x25 mL). The organic phases were dried with MgSO₄ and the solvent was removed under reduced pressure. The crude product was chromatographed on neutral alumina (CH₂Cl₂/EtOAc = 9.5 : 0.5). The pure product (*R*)-**8** was collected as a yellow oil (0.94 g, 87%).

In a Schlenk apparatus, a mixture of (*R*)-8 (0.465 g, 0.9 mmol), 4-formylphenylboronic acid **10** (1.030 g, 6.9 mmol), $\text{Pd}(\text{PPh}_3)_4$ (0.100 g, 0.086 mmol) and CsF (1.88 g, 12.3 mmol) was dissolved in 10 mL of H_2O /toluene/ CH_3OH (1:1:0.5). The mixture was stirred under N_2 for 24 hours at 90 °C. The solvent was removed under reduced pressure. The resulting brown oil was dissolved in CHCl_3 and the solution washed with H_2O . The organic phases were dried over MgSO_4 , filtered on Celite and the solvent was removed under reduced pressure. The resulting brown oil was precipitated by crystallization from THF/hexane to yield the product (*R*)-9 as pale yellow solid.

2.8 Synthesis of complex (R)-1b

To a suspension of ligand (R)-9 (100 mg, 0.18 mmol) in CH_3CN (25 mL) zinc(II) perchlorate hexahydrate was added (67 mg, 0.18 mmol). The solution was stirred at room temperature for 1 hour and the reaction was followed by $^1\text{H-NMR}$ and ESI-MS. At the end of the reaction Et_2O (25mL) was added, obtaining quantitatively a crystalline solid then centrifugated and dried. Complex (R)-1b resulted as pale yellow solid (154 mg, 95%).

2.9 Synthesis of Cages X@2a and X@(R,R)-2b.

General procedure for the synthesis of molecular cages **X@2a** and **X@(R,R)-2b**. Perchlorate counterions are removed for clarity. Citric acid **Cit** has been employed as guest only in the presence of complex **1a**.

To 500 μl (1.0 μmol) of a solution 0.002 M of complex **1a** or **(R)-1b** in DMSO- d_6 , 50 μl (0.5 μmol , with 2 eq. of triethylamine) of a solution 0.01 M in DMSO- d_6 of a dicarboxylic acid **X** and 125 μl (2.5 μmol) of a solution 0.02 M in DMSO- d_6 of ethylenediamine were added in a NMR tube. The mixture was left for 12 hours at room temperature and checked *via* $^1\text{H-NMR}$ and ESI-MS. The yield for all the cages is >95% (Determined *via* $^1\text{H-NMR}$ based on internal standard *p*-xylene).

2.10 Synthesis of Cages in the presence of complex mixtures

General procedure for the synthesis of molecular cages **X@2a** and **X@(R,R)-2b**. Perchlorate counterions are removed for clarity.

To 500 μl (1.0 μmol) of a solution 0.002 M of complex **1a** or **(R)-1b** in DMSO- d_6 , 15 μL of Complex mixture without pre-treatment and 125 μl (2.5 μmol) of a solution 0.02 M in DMSO- d_6 of ethylenediamine were added in a NMR tube. The mixture was left for 12 hours at room temperature and checked *via* $^1\text{H-NMR}$ and ESI-MS. The concentration of **L-Tar@2a**, **L-Mal@2a**, and **L-Suc@2a** was determined *via* $^1\text{H-NMR}$ based on internal standard *p*-xylene, Table S1).

3 Self Assembly with different amount of Wine

General procedure for the synthesis of molecular cage **X@2a** using different quantities of Valpolicella wine. Perchlorate counterions are removed for clarity.

To 500 μL (1.0 μmol) of a solution 0.002 M of complex **1** in $\text{DMSO-}d_6$ different amount of Valpolicella wine (15 μL , 30 μL , 50 μL , 75 μL , 100 μL , and 125 μL) without pre-treatment were added (triethylamine was added to correct the acidity of wine). In order to keep the concentration constant, $\text{DMSO-}d_6$ was added to reach the final volume of 625 μL . Then, 125 μL (2.5 μmol) of a solution 0.02 M in $\text{DMSO-}d_6$ of ethylenediamine were added slowly under stirring. The mixture was left for 12 hours at room temperature and checked *via* $^1\text{H-NMR}$ using p-xylene as internal standard.

5 Determination of the enantiomeric excess of (*R*)-**7**

The enantiomeric excess of the chiral amine **R-7** has been determined using a procedure reported by Bull *et al.*¹ To obtain the derivatization, 1.0 equiv. of boronic acid **11**, 1.1 equiv. of (*S*)-**BINOL** and 1.0 equiv. of the racemic amine **7** was dissolved in CDCl₃ in the presence of 4 Å molecular sieves and the ¹H-NMR was acquired after 5 minutes. The reaction led to the formation of rigid diastereoisomeric imino-boronate esters (*S-R*)-**7** and (*S-S*)-**7**

The ¹H-NMR spectrum of racemic **7** showed a good separation of the doublet of the methyl group, the quartet of the benzylic proton, and the imine proton due to the significantly different anisotropic effects experienced by the amine fragments in the presence of more than one aryl substituent. As expected, the racemic mixture presented the doubling of the signal in a 1:1 ratio, making this method suitable for the determination of the enantiomeric excess of the crystallized amines (Figure S8).

As shown in Figure S9, the ¹H-NMR of **R-27**, after four crystallizations, showed the presence of only one diastereomer in solution, with the disappearance of the signals of the second specie, indicating the complete resolution of the enantiomer. The absolute configuration of the enantiomer has been attributed from the work of Bull taking α -phenylethylamine as reference.

5.1 Procedure for the enantiomeric excess determination of 1-(5-bromopyridin-2-yl)ethan-1-amine (**7**)

In a vial, 1.1 equiv. of (*S*)-(-)-1,1'-Bi(2-naphthol) (**S**)-**BINOL**, 1.0 equiv. of 2-formylphenylboronic acid **8** and 1.0 equiv. of 1-(5-bromopyridin-2-yl)ethan-1-amine **7** or (**R**)-**7** were dissolved in 2 mL of CDCl₃ in the presence of 4 Å molecular sieves. The ¹H-NMR spectrum of an aliquot was acquired after 5 minutes.

6 Determination of the enantiomeric excess of zinc complex (**R**)-1b

Since it was not possible to find a method for the quantification of enantiomeric excess of the ligand (**R**)-**9** using neither chiral chromatography nor chiral derivatization, the attention was focused on the zinc complex (**R**)-**1b**.

The capability of the zinc complex to bind chiral carboxylic acid was exploited to determine its enantiomeric excess using NMR technique.

To analyze the optical purity of the both zinc complexes (**R**)-**1b** using NMR analysis, (*S*)-(+)-2-methoxy-2-phenylacetic acid **12** was employed as CSR

Adding chiral acid **12** to a solution of the racemic complex **rac-1b** in $\text{DMSO-}d_6$ allowed to observe a doubling of the signals in the region of the α pyridine protons between 8.90 ppm and 9.30. From the relative ratio of the areas of the signals it was possible to estimate directly the enantiomeric excess of the complex, considering the experimental error of the NMR technique. As shown in Figure S10, the racemic complex presented two doubling peaks with the same areas.

Figure S10 ¹H-NMR (DMSO-*d*₆, 600 MHz) spectrum of a) **rac-1b** complex, b) **rac-1b** complex after the addition of (*S*)-(+)-2-methoxy-2-phenylacetic acid **12**. From the relative ratio of the areas it was possible to estimate the enantiomeric excess.

The enantiomeric excess of zinc complex (**R**)-**1b**, has been reported in Figure S11.

From the relative ratio of the areas of the obtained signals, more than 90% of enantiomeric excess was estimated.

Figure S11 $^1\text{H-NMR}$ ($\text{DMSO-}d_6$, 600 MHz) spectrum (**R**)-**1b** complex after the addition of (*S*)-(+)-2-methoxy-2-phenylacetic acid **12**. From the relative ratio of the areas it was possible to estimate an enantiomeric excess of more than 90%.

6.1 General procedure for the enantiomeric excess determination of the complex.

To 400 μL (1.0 μmol) of a 0.002 M solution of complex (**R**)-**1b** in $\text{DMSO-}d_6$, 122 μL (1.0 μmol) of a 0.01 M solution of (*S*)-(+)-2-methoxy-2-phenylacetic acid **12** in $\text{DMSO-}d_6$ of were added in a NMR tube. The mixture was checked *via* $^1\text{H-NMR}$.

7 Stereochemical considerations on the possible cages present in solution

Due to presence of a stereocenter in one arm of the **TPMA** complexes, during the cage formation more than one assembly could be obtained. In particular, three different structures could be formed using **(R)-1b** complex. The resulting structures are all diastereoisomers since there is not any symmetry operation that could interconvert them to each other (Figure S12).

Figure S12 Different diastereoisomers of cages $X@(\mathbf{R},\mathbf{R})\text{-2b}$ formed in solution using enantiopure complex **(R)-1b**.

8 Addition of D-tar to Wine@(*R,R*)-2b

In order to test cage capability to sense unnatural enantiomers in the complex matrix, increasing amounts of unnatural **D-Tar** have been added to Valpolicella wine and used as templating agents for cage formation. After determination of L-Tartaric acid content in Valpolicella wine using $^1\text{H-NMR}$ (2.3 g/L, Figure S49) different amount of **D-Tar** acid has been added to obtain different enantiomeric excesses. Since cage **X@(*R,R*)-2b** is chiral, **DL-Tar** (0.2 eq.) was added to a solution of complex (***R***)-**1b** and ethylenediamine in order to understand if there was no preference in binding for one of the two chiral dicarboxylic acids. As shown in Figure S13 no preference was observed.

10 Quantification of Dicarboxylic acids Content in Complex mixtures

In order to determine the concentration of Tartaric, Malic, and Succinic acids in the complex mixtures, the concentration of cages **L-Tar@2a**, **L-Mal@2a**, and **L-Suc@2a** has been determined using p-xylene as internal standard.

Table S1. Quantification of Tartaric, Malic, and Succinic acids content in the complex mixtures.

Complex Mixture	Tartaric Acid (g/L)	Malic Acid (g/L)	Succinic Acid (g/L)
Prosecco	1.3	1.6	0.3
Chianti	2.4	n.d	0.7
Chardonnay	1.5	1.6	0.2
Valpolicella	2.0	0.3	0.7
Müller-Thurgau	1.5	1.7	0.5
Barbera	2.5	n.d	0.5
Grapes Juice Squeezed	3.6	n.d	n.d
Blueberry Alcenera	n.d	1.4	n.d*
Blueberry Zuegg	n.d	2.5	n.d*
Blueberry Juice Squeezed	n.d	2.1	n.d*
Apple Juice	n.d	4.7	n.d
Apple Juice Squeezed	n.d	3.9	n.d
Pear Juice	n.d	2.1	n.d
Blueberry-Grape Juice	0.5	1.6	n.d*
Peach Juice	n.d	1.8	n.d*

*The peak of succinic acid could be overlapped to the citric acid peak at 9.33 ppm

11 Chromatographic Analysis

In order to verify the reliability of the quantification of Tartaric, Malic, and Succinic acids *via* $^1\text{H-NMR}$ using the supramolecular cage **2a** as probe, a chromatographic analysis has been performed.

The HPLC method parameters have been reported in Table S2.

Table S2. HPLC Method Parameters.

HPLC Method Parameters	
Column	Eurospher II 100-5 C18, 5 μm , 4.6 x 250 mm
Mobile Phase	Isocratic, 25 mM K-phosphate buffer; pH 2.4
Flow Rate	1.5 mL/min. (~ 2600 psi)
Oven Temp.	30 $^\circ\text{C}$
UV detection	Wavelength: 210 nm
Injection Volume	20 μL

The Chromatogram of the mixtures of the three dicarboxylic acids is reported in Fig. S73.

Figure S73: Chromatogram of the mixture of Tartaric (ret. time 2.43 min), Malic (ret. time 3.29 min), and Succinic (ret. time 8.20 min) acids.

For calibration purposes, five solutions with different concentrations (ranging from 20 to 1000 ppm) have been prepared for Tartaric, Malic, and Succinic acids (Fig. S74-S76).

Fig S74 Calibration curve for Tartaric acid.

Fig S75 Calibration curve for Malic acid.

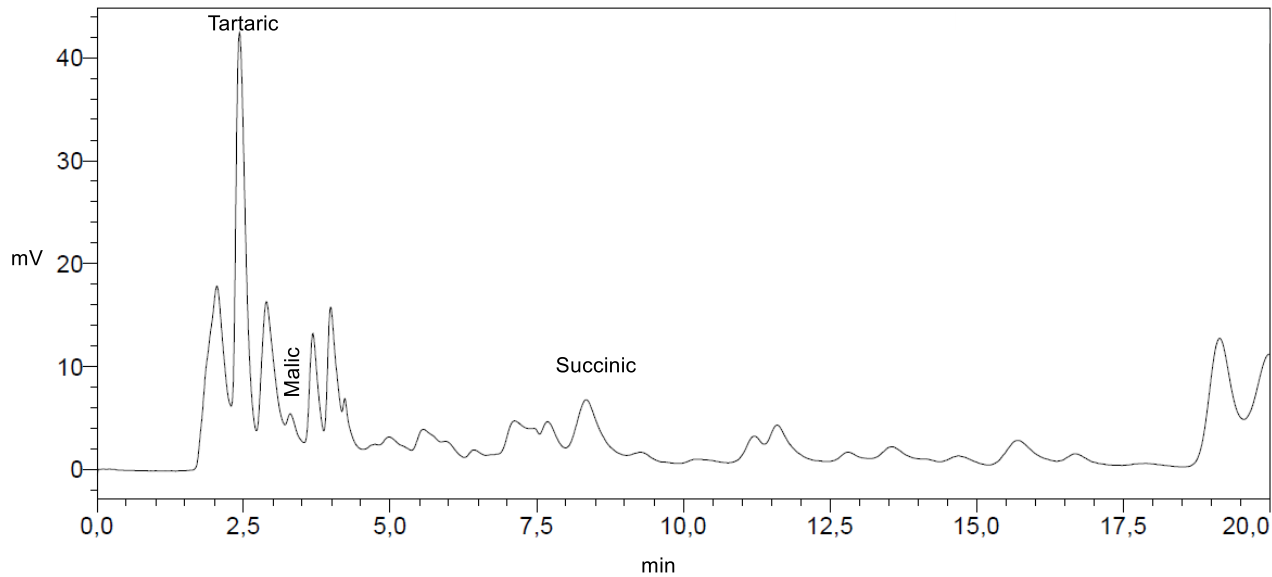

Fig S76 Calibration curve for Succinic acid.

Commercial red wine (Valpolicella), white wine (Müller-Thurgau), and apple juice have been diluted 5:1 with HPLC-grade water, filtered and then injected.

The three chromatograms are reported in Figure S77.

a)

Figure S77 Chromatogram of a) Valpolicella wine, b) Müller-Thurgau wine, and c) apple juice.

As reported in Table S3 a good agreement between the two measurements has been found.

Table S3. Quantification of Tartaric, Malic, and Succinic acids content in the complex mixtures with HPLC and *via* $^1\text{H-NMR}$ using cage **2a** as probe.

Complex Mixtures		HPLC (g/L)	$^1\text{H-NMR}$ (g/L)
Valpolicella Wine	Tartaric	1.8	2.0
	Malic	0.2	0.3
	Succinic	0.9	0.7
Müller-Thurgau Wine	Tartaric		1.5
	Malic	1.7	1.7
	Succinic	0.6	0.5
Apple Juice	Tartaric	0.1	n.d.*
	Malic	4.6	4.7
	Succinic	0.1	n.d.*

* In the case of apple juice tartaric and succinic acids were not observed in the $^1\text{H-NMR}$ spectrum (Fig S56). This could be probably due to the fact that the concentration of malic acid is such high that the cage is completely saturated by malic acid.
