General Procedures and Materials.

Anhydrous dichloromethane, tetrafluor and dimethyl formamide were gained from PureSolv MD 5 (Inert solvent purification system). Anhydrous chlorobenzene and triethylamine were distilled over calcium hydride (CaH₂) under Ar atmosphere. S/R-CQₙ-b (n=0, 1, 2, 3) were prepared according to our previous work.1 Column chromatography was carried out on flash grade silica gel, using 0 - 20 psig pressure. Analytical TLC was carried out using tapered silica plates with a preadsorbent zone. NMR spectra were obtained with a Bruker spectrometer (400 MHz) and JEOL Delta (400 MHz and 600 MHz) using chloroform-d (CDCl₃) as solvents. The chemical shift references were as follows: (¹H) chloroform-d, 7.26 ppm; (¹³C) chloroform-d, 77.00 ppm (chloroform-d), (¹H) dichloromethane-d₂, 5.32 ppm. Mass spectra (ESI, MALDI) were acquired on GCT and FT-ICR spectrometer (Bruker Daltonics Inc. APEXII, BIFLEX III), respectively. CD spectra were recorded on a Chirascan TM Circular Dichroism spectrometer (Applied Photophysics Ltd, Surrey, United Kingdom). CPL spectra were gained with JACSO CPL-300.

Synthesis

Synthesis of helicities of S/R-1a~1b.

Scheme S1 Synthesis of compound S/R-1a~1b. Conditions: i. Pd(PPh₃)₂Cl₂, Cul, anhydrous THF and anhydrous Et₃N, aromatic acetylene, room temperature; ii. NaOH, THF/MeOH, 40°C; iii. HATU, DIEA, anhydrous DMF, S- or R- chiral amines; iv. Iron powder, CH₃COOH, MeOH, reflux; v. C₂Cl₂O₂, dry DCM, room temperature; DIEA, anhydrous DCM, room temperature.

General procedure for compound 6a~6b: The general Sonogashira coupling procedure described above was used to prepare this compound. 500 mg of 4-bromo-8-nitro-2-quinoline carboxylate (compound 5) (1.61 mmol, 1.0 equiv.), aromatic acetylene (1.93 mmol, 1.2 eq.), 56 mg of Pd(PPh₃)₂Cl₂ (0.08 mmol, 0.05 eq.), and 0.1 equivalents of Cul (31 mg, 0.16 mmol) were combined in a Schlenk flask with 5 mL dry THF and 5 mL dry Et₃N. Once dissolved, the solution
turned into black immediately. Then the solution was stirred at room temperature for overnight. Once done, the solvent was removed at vacuum and the product was soluted in DCM then washed by NH₄Cl saturated solution and NaCl solution for three times. The organic layer was dried by MgSO₄ and then purified by flash chromatography (SiO₂, Hexane/DCM stepwise elution, 15:1 to 3:1).

General procedures for compound 7a–7b: 1.0 mmol compound 6a–6b was dissolved in 5 mL THF and 1 mL MeOH, and 100 mg sodium hydroxide (2.5 mmol, 2.5 equiv.) was dissolved in 1 mL water which was then added to above solution dropwise. The solution was then stirred at 40 °C for about 40 min until TLC monitored that compound 6a–6f completely disappeared. After the solution was cooled into room temperature, dilute hydrochloric acid was added to make the solution pH around 1–4. After that, wash the solution with dichloromethane and the organic layer was dried by sodium sulfate powders. Compound 7a–7f was gained after solvent removed.

General procedures for compound S/R-8a–8b: 0.5 mmol compound 7a–7b and 0.5 mmol compound chiral amine, 0.52 mmol (1.2 equiv.) 2-(7-Azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU) was dissolved in 3 mL anhydrous DMF, and then 1.0 mmol (2.0 equiv.) N,N-Diisopropylethylamine was added. The mixture was stirred at room temperature for overnight. Then the solution was dissolved in 20 mL DCM, and was washed by saturated NH₄Cl solution. After the organic layer was dried and solute was removed, the crude was purified by column chromatography (SiO₂, Hexane/DCM stepwise elution, 10:1 to 5:1).

General procedures for compound S/R-9a–9b: 0.5 mmol compound S/R-8a–8b was dissolved in 20 ml methyl alcohol in a 100 mL round flask and 3 ml glacial acetic acid was added. This heterogeneous mixture turned to homogeneous as the temperature increased. After the temperature of solution increased to 75 °C, 2.0 mmol (4.0 equiv.) Fe powder was added to the solution with stirring in three portions within 30 minutes, poured over the mixture of ice and water, and then extracted with DCM. The organic phase was washed three times with saturated aqueous NaHCO₃ and brine respectively, dried over sodium sulfate and concentrated in vacuo to give brown red residue which was then purified by column chromatography (SiO₂, Hexane/DCM stepwise elution, 10:1 to 5:1).

General procedures for compound S/R-1a–1b: 0.1 mmol (1.0 equiv.) compound 10 was suspended in anhydrous CH₂Cl₂ (2 mL) under argon. 0.5 mmol (5 equiv.) oxalyl chloride were added carefully to the mixture because of gas evolution. The reaction slowly turned to a yellow homogeneous solution over 2 h. The solution was concentrated in vacuo to give the acid chloride as an yellow solid, which was pumped dry for 2 h. 0.2 mmol (2.0 equiv.) compound S/R-9a–9b and 0.5 mmol (5.0 equiv.) N, N-diisopropylethylamine were dissolved in anhydrous CH₂Cl₂ (3 mL) under argon with stirring. The acid chloride was dissolved in anhydrous CH₂Cl₂ 5 mL, then were added into amine liquor immediately. After stirring for overnight, TLC analysis indicated completion of the reaction. The mixture extracted with CH₂Cl₂. The resultant crude material was purified by column chromatography (SiO₂, Hexane/DCM stepwise elution, 10:1 to 2:1) to give compounds Cod-68 as a light-yellow solid.

**Compound 6a:** 491 mg compound 6a was gained as a brown solid, yield 92%. ¹HNMR (400 MHz, CDCl₃) δ 8.63 (d, J=8.4 Hz, 1H), 8.45 (s, 1H), 8.15 (d, J=7.6 Hz, 1H), 7.80 (t, J=7.6 Hz, 1H), 7.69 (dd, J=1.5, 7.3 Hz, 1H), 7.46-7.49 (m, 3H), 3.97 (s, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 165.1, 149.6, 149.0, 139.2, 132.2, 132.03, 130.2, 129.3, 128.8, 127.7,

Synthesis of helicities of S/R-PCQ$_2$-b.

Scheme S2 Synthesis of compound S/R-PCQ$_2$-b. Conditions: i. HATU, DIEA, anhydrous DMF, S- or R- chiral amines; ii. Iron powder, CH$_3$COOH, MeOH, reflux; iii. C$_5$Cl$_3$O$_2$, dry DCM, room temperature; iv. DIEA, anhydrous DCM, room temperature.
**General procedures for Compound S/R-CQ₁-b:** 0.2 mmol compound CQ₁ acid and 0.2 mmol compound chiral amine, 0.24 mmol (1.2 equiv.) 2-(7-Azabenzotriazol-1-yl)-N,N',N'-tetramethyluronium hexafluorophosphate (HATU) was dissolved in 3 mL anhydrous DMF, and then 0.4 mmol (2.0 equiv.) N,N-Diisopropylethylamine was added. The mixture was stirred at room temperature for overnight. Then the solution was dissolved in 20 mL DCM, and was washed by saturated NH₄Cl solution. After the organic layer was dried and solute was removed, the crude was purified by column chromatography (SiO₂, Hexane/DCM stepwise elution, 10:1 to 5:1).

**General procedures for compound S/R-CQ₁-b-NH₂:** 0.15 mmol compound S/R-CQ₁-b was dissolved in 5 mL ethyl acetate with 80 mg 10% wt. Palladium on activated carbon. The solution was stirred at hydrogen atmosphere at room temperature for overnight. After the catalyst was filtered with silica and solvent removed at vacuum, the target product was gained without further purification.

**General procedures for compound S/R-PCQ₂-b:** 0.1 mmol (1.0 equiv.) compound 10 was suspended in anhydrous CH₂Cl₂ (2 mL) under argon. 0.5 mmol (5 equiv.) oxalyl chloride were added carefully to the mixture because of gas evolution. The reaction slowly turned to a yellow homogeneous solution over 2 h. The solution was concentrated in vacuo to give the acid chloride as an yellow solid, which was pumped dry for 2 h. 0.2 mmol (2.0 equiv.) compound S/R-CQ₁-b-NH₂ and 0.5 mmol (5.0 equiv.) N, N-diisopropylethylamine were dissolved in anhydrous CH₂Cl₂ (3 mL) under argon with stirring. The acid chloride was dissolved in anhydrous CH₂Cl₂ (5 mL), then were added into amine liquor immediately. After stirring for overnight, TLC analysis indicated completion of the reaction. The mixture extracted with CH₂Cl₂. The resultant crude material was purified by column chromatography (SiO₂, Hexane/DCM stepwise elution, 10:1 to 2:1) to give compounds Cod-68 as a light-yellow solid.

Φ is measured using a calibrated integrating sphere, excited at 360 nm. B_{CPL} refers to the resulting brightness which is calculated by
\[ B_{CPL} = \varepsilon_{ex} \cdot \Phi \cdot \frac{|g_{lum}|}{2} \]
while \( \varepsilon_{ex} \) is the extinction coefficient at the excitation wavelength.
