**Fig. S8.** Occupied Molecular Orbital (OMO) for the complex polymers were lowest that Fdc<sup>2-</sup> anion this is indicated for compounds **1-7.** 15

### 1 General information and materials.

All chemicals were commercially available and were purchased from Sigma-Aldrich as reagent grade quality and used without further purification. Elemental analysis was carried out on an EA1108 CHNS-O Fision Instrument.

### 2 Synthesis of compounds 1-7.

1,1'-ferrocenedicarboxylic acid (50.1 mg, 0.11 mmol) and 4,4'-bipy (52.1 mg, 0.33 mmol) were mixed with H<sub>2</sub>O and the metallic acetate M(OAc)<sub>2</sub> according to the schematic diagram shown in Fig. S1. Then, these were heated in a Teflon-lined autoclave from 80 to 100 °C for three days. Good quality crystals were obtained.

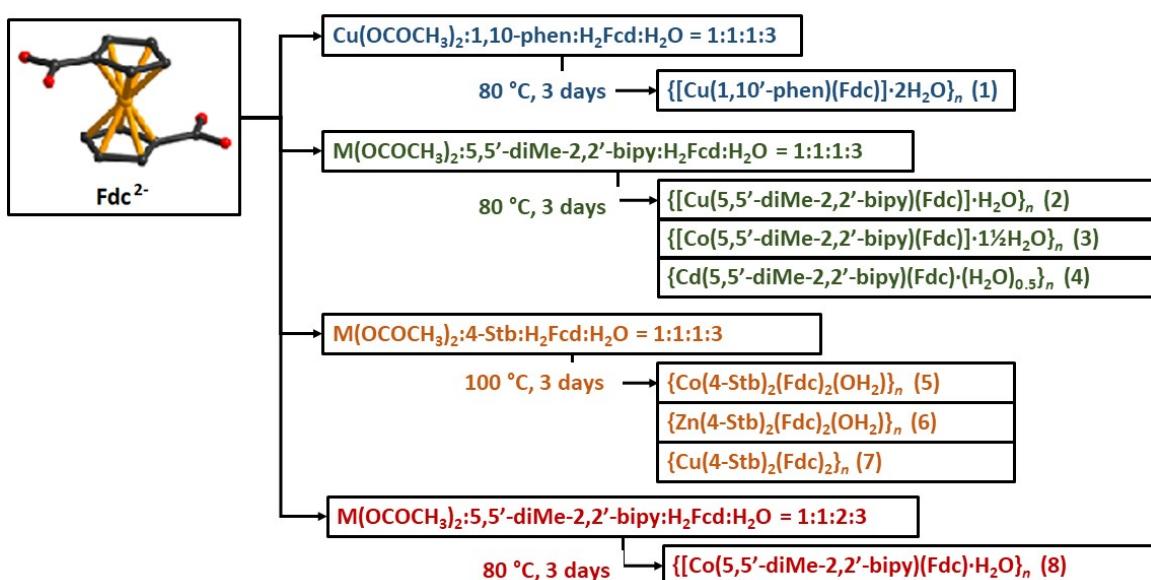

Fig. S1. Schematic reaction condition of MOMNs.

### 3 Crystal structure determination.

The single-crystal data collection was carried out on three different diffractometers. For the compounds **1**, **3** and **5** the data were collected on Rigaku AFC-7, Mercury II (Centro de Química, Instituto Venezolano e Investigaciones Científicas, Miranda, Venezuela) at 298 (2) K with Mo-K $\alpha$  radiation. The single crystals were selected and mounted on a glass fiber. In the case, the compound **2** data were collected performed at 193 (2) K with an APEX II Bruker-AXS (Centre de Diffractométrie, Université de Rennes 1, France) with Mo-K $\alpha$  radiation. For last, compounds **4**, **6**, and **7** data were collected on an Agilent SuperNova, CrysAlis Pro, Oxford Cryojet, detector Atlas with Mo/Cu radiation (Universidad de Los Andes, Bogotá, Colombia). The single crystal was always coated in paratone oil once removed from the mother solution.

The data merging process was performed using the *CrystalClear*, *CrysAlisPro*, and *SCALAPACK* programs for source data of Rigaku AFC-7, Agilent SuperNova CrysAlisPro, Software System, Version 171.37.34, and APEX II Bruker-AXS, respectively.

Structure determinations were performed by dual-space iterative phasing algorithm<sup>1</sup> with the solving program SUPERFLIP,<sup>2</sup> that revealed all the non-hydrogen atoms. SHELXL-2018,<sup>3,4,5</sup> program was used to refine the structures by full-matrix least-squares based on  $F^2$  with the use of SHELXE program.<sup>6</sup> Most non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms were included in idealized positions and refined with isotropic displacement parameters. The SQUEEZE method was performed for

compounds **1** and **3** for addressing the solvent disorder issue.<sup>7</sup> In these compounds found that the solvent disorder issue corresponds one molecule of water in both cases. Table S1 gives the crystallographic data for the derivatives **1** and **3** after its PLATON-SQUEEZE treatment. Table S1 shows crystallographic and refinement details, some selected bond distances and angles, and torsion angles are shown in Table S2. Table S3 displays hydrogen-bond geometry for compounds **1** - **2**. CCDC reference numbers CCDC 1830992, 1939225-1939233 contain the supplementary crystallographic data for derivatives **2**, **1**, **3-6**, respectively. These data can be obtained free of charge at [www.ccdc.cam.ac.uk/conts/retrieving.html](http://www.ccdc.cam.ac.uk/conts/retrieving.html) or from the Cambridge Crystallographic Data Center, 12 union Road, Cambridge CB2 1EZ, UK; Fax: (internet.) + 44-1223-336-033; E-mail: [deposit@ccdc.cam.ac.uk](mailto:deposit@ccdc.cam.ac.uk).

#### **4 Powder X-ray diffraction patterns data.**

The powder diffraction patterns data were collected with the powder X-ray diffractometer Bragg-Brentano geometry on Siemens, D5005 at the University of The Andes, Mérida, Mérida-Venezuela, with the powdered samples were mounted on the axis of the diffractometer and spun during measurements. This diffractometer is equipped with a monochromator of graphite. Data were collected for several minutes with Cu-K $\alpha$  ( $\lambda = 1.54059 \text{ \AA}$ ) anode focus length and fine, powered at 40 kV-30 mA. Additionally, for the data collection, a fixed slit and a divergence slit of 1 mm were used. A sample was made in a record of the maxima in the angular range of 10° to 100° in 2 $\theta$ , using a step size of 0.02° and a counting time of 40 s per step.

#### **5 FT-IR Measurement.**

KBr pellets of the product compounds were used for IR data recording on a NICOLET MAGNA 560 spectrophotometer in the 400-4000 cm<sup>-1</sup> region.

#### **6 TGA-Measurement.**

TGA measurements were performed on a Netzsch STA 409. The samples were prepared by loading into Alumina's crucibles in quantities between 8 - 10.0 mg for each one. Test were carried-out by heating the sample from 30 to 600°C at a rate of 10 °C min<sup>-1</sup> under a nitrogen atmosphere.

#### **7 Powder X-ray Diffraction Analysis**

The peak shapes were modeled using the split pseudo-Voigt peak shape function. The background was initially determined automatically and then modeled using the B-spline function. Restraints on distances and angles bond do not were applied. However, these were taken in the refinement fixed rigid model. The global isotropic atomic displacement parameters were refined as one overall U<sub>iso</sub> for all atoms starting from a value of 0.03 Å<sup>2</sup>. At this point, the Figures of Merit obtained for the WPPF refinement were: R<sub>p</sub> = 0.068, R<sub>wp</sub> = 0.087, R<sub>exp</sub> = 0.070, and  $\chi^2 = 1.57$ .

Structure Refinement by whole powder pattern fitting (WPPF) Table S5 shows the refined parameter by whole powder pattern fitting (WPPF)<sup>8-10</sup> methodology using *SmartLab Studio* 4.3 program.<sup>11</sup> The non-hydrogen atoms crystallographic positions for 2'-Co(II) (**8**), 3- Co(II), and Mc-Co(II) were obtained of **2**, **3**, and **Mc-Co(II)** from CSD Code: HUGSAF. The hydrogen atoms were token as riding models.

#### **8 Differential pulse voltammetry.**

Differential pulse voltammetry studies were carried out on a Voltalab 80 (Radiometer Analytical) using a three-electrode configuration consisting of a Pt working electrode, a Pt auxiliary electrode, and a commercially available Ag/AgCl electrode as a reference with a pure Ar gas inlet and outlet. The

measurements were performed in DMF solution containing Tetrabutylammonium hexafluorophosphate (TBAPF<sub>6</sub>) (0.1 M) as supporting electrolyte, with 50 ms pulses. The potential from + 0.3 to +1.1 V was scanned at a scan rate of 20 mVs<sup>-1</sup> and with 50 ms pulses.
