## Experimental section

1.2. Synthesis Procedure. BMeTTPAL was readily synthesized by the Jones oxidation ${ }^{1}$ and the following Suzuki-Miyaura coupling ${ }^{2}$ (Scheme S1). The model compound was characterized and confirmed by $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ and $100 \mathrm{MHz}{ }^{13} \mathrm{C}$ spectroscopy (Bruker AVANCE III) and highresolution mass spectroscopy (HRMS, 1290 UPLC (Agilent)/ micrOTOF-Q II (Bruker)).

Scheme S1. Synthesis of compound A.
Preparation of 1-2 by Jones oxidation ${ }^{1}$ : acetic acid ( 20.0 mL ), acetic anhydride ( 40.0 mL ) and 1,4-dibromo-2,5-dimethylbenzene ( $\mathbf{1 - 1}, 4.0 \mathrm{~g}, 0.015 \mathrm{~mol}, 1.00 \mathrm{eq}$.) were added in a flask, then the sulfuric acid $(14.0 \mathrm{~mL})$ was added dropwise to this mixture and stirred at $0^{\circ} \mathrm{C}$. New grinding $\mathrm{CrO}_{3}(6.0 \mathrm{~g}, 0.06 \mathrm{~mol}, 4.00 \mathrm{eq}$.) was slowly added in portions and stirred vigorously for another 5 hours at $0{ }^{\circ} \mathrm{C}$. After the reaction finished, poured the greenish slurry into ice-water bath and filtered. The filter residue was further washed with ice water and cold methanol (about $-15^{\circ} \mathrm{C}$ ). Then, the intermediate was carried on hydrolysis reaction under refluxing condition. The relevant solvents are ethanol $(20.0 \mathrm{~mL})$, water $(20.0 \mathrm{~mL})$ and sulfuric acid $(2.0 \mathrm{~mL})$. After cooling the reaction to $0{ }^{\circ} \mathrm{C}$, the crude $1-2$ was separated by filtration. The pure product was obtained by recrystallization from chloroform in 35\% yield.

Preparation of compound A by a Suzuki-Miyaura cross coupling ${ }^{2}$ : 1-2 $(146 \mathrm{mg}, 0.50 \mathrm{mmol}, 0.50$ eq.), $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(17.5 \mathrm{mg}, 0.03 \mathrm{mmol}, 0.03 \mathrm{eq}$.$) , substituted-thiophene-2-boronic acid pinacol$ ester ( $1.25 \mathrm{mmol}, 1.25 \mathrm{eq}$.) and $1.0 \mathrm{mLCs}_{2} \mathrm{CO}_{3}(0.82 \mathrm{~g}, 2.50 \mathrm{mmol}, 2.50$ eq.) solution ( 2 M ) in 5.0 mL dry THF were refluxed 48 hours under an nitrogen atmosphere. After finished, the mixture was extracted with ethyl acetate. The organic phase was further washed with saturated NaCl solution, water and dried with anhydrous $\mathrm{Mg}_{2} \mathrm{SO}_{4}$. The product was obtained by flash column chromatography or recrystallization in acetone with $85 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=$ $10.27(\mathrm{~s}, 2 \mathrm{H}), 8.08(\mathrm{~s}, 2 \mathrm{H}), 6.91(\mathrm{~d}, \mathrm{~J}=3.5,2 \mathrm{H}), 6.83(\mathrm{dd}, \mathrm{J}=3.5,1.1,2 \mathrm{H}), 2.57(\mathrm{~d}, \mathrm{~J}=0.9,6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta=191.44,143.32,136.88,136.62,135.06,130.56,130.09,126.42$, 15.40. HRMS $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{18} \mathrm{H}_{14} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}$ 349.0333, found 349.0312.

## Computer simulation of BMeTTPAL molecule.

Conformer I

Conformer II

Conformer III

Conformer IV

Fig. S10 Schematic diagram of different conformers of BMeTTPAL molecule in acetone. The energy of conformers, HOMO, LUMO and gap (LUMO-HOMO) can be seen in Table S5 and Figure S9. The calculation was based on M06-2X/6-311G(d,p) level and acetone was used as the solvent for calculations (Solvation Model Based on Density) at the M06-2X/6-311G(d,p) level.

Table S5. Energy data of different conformers of BMeTTPAL molecule.

| Solvents | I | II | III | IV |
| :--- | :---: | :---: | :---: | :---: |
| Toluene | -1641.025771 | -1641.014536 | -1641.023030 | -1641.014188 |
| 1,4-Dioxane | -1641.018699 | -1641.007077 | -1641.015872 | -1641.006693 |
| Chloroform | -1641.027723 | -1641.017350 | -1641.024746 | -1641.017572 |
| Acetone | -1641.030041 | -1641.020247 | -1641.026791 | -1641.020773 |
| Acetonitrile | -1641.028984 | -1641.019674 | -1641.025648 | -1641.020134 |

Note: The calculation was based on M06-2X/6-311G (d,p) level by Gaussian 09 software. Unit: Hartree.

Fig. S11 (a) The diagram of energy of potential conformations of BMeTTPAL, the lowest energy of conformation I is set as $0 \mathrm{~kJ} \mathrm{~mol}^{-1}$ in different solvents.

Fig. S12 ESP-mapped molecular vdW surface of solvent molecules: toluene (a), 1,4-dioxane (b), chloroform (c), acetone (d), acetonitrile (f). Surface local minima and maxima of ESP (units: kcal mol-1) are represented as cyan and orange spheres, respectively. The global minimum and maximum values are italic. The calculation was based on M06-2X/6-311G (d,p) level. ${ }^{4-5}$

Fig. S13 The 1:1 complex of CA and toluene (a), 1,4-dioxane (b), chloroform (c), acetonitrile (d). Visualization in the molecular space of non-covalent interaction (NCI isosurfaces corresponding to $\mathrm{RDG}=0.50$ a.u.) and topological AIM graph in the dimer of CA and acetone. The orange lines represent the bond paths, the orange balls represent the bong critical points (BCPs).
