1. Computational Methods

The geometries of the molecules were fully optimized by using the wB97X-D hybrid functional¹ in combination with the def2-TZVPD basis set.^{2,3} The nature of minimum of all computed structures was confirmed by performing a frequency analysis at the same level of theory. Thermochemical corrections at 298.15 K were calculated for all stationary points from unscaled vibrational frequencies. The stability of the wave functions was checked for all the optimized structures.⁴ Single point calculations of the optimized geometries were performed at the DLPNO-CSSD(T)⁵/ma-def2-TZVPP⁶ theoretical level and were combined with the previous computed thermochemical corrections to yield free energies G_{298} at 298.15 K. All calculations were performed by using both the Gaussian 09⁷ and the ORCA 4.0.1 programs.⁸ Natural Bond Orbital analyses⁹ were performed at the wB97XD/def2-TZVPD level with the NBO 7.0 software.¹⁰

2. Relative Energies of the 1,4-Diazabutatrienes

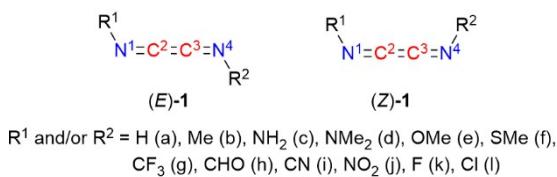

Table S1. Gibbs free energy difference between the (*E*)- and (*Z*)-diazabutatrienes **1** (kcal mol⁻¹). Values are obtained as $G_E - G_Z$

5. Stabilization Energies

The stabilization energy values are calculated as the variation of the reaction enthalpy of the reaction shown in the schemes. Thus, the SE values shown in Table S10 are obtained as follow:

$$SE = [\Delta H \text{ 2a(a-l)} + \Delta H \text{ 1(a-l)b}] - [\Delta H \text{ 1(a-l)(a-l)} + \Delta H \text{ 2ab}]$$

Table S10. Computed stabilization energies (SE, kcal mol⁻¹) following the homodesmotic reaction shown below.

5. Computational Data

Table S13. Electronic ($E_{\text{SCF},298}$), Gibbs free (G_{298}), and enthalpic (H_{298}) energies for systems shown in Table S10 (in Hartree) computed at the DLPNO-CSSD(T)/ma-def2-TZVPP//wB97X-D/def2-TZVPD level. The wB97X-D/def2-TZVPD level of theory was used to optimize the geometries and calculate the thermal corrections.
