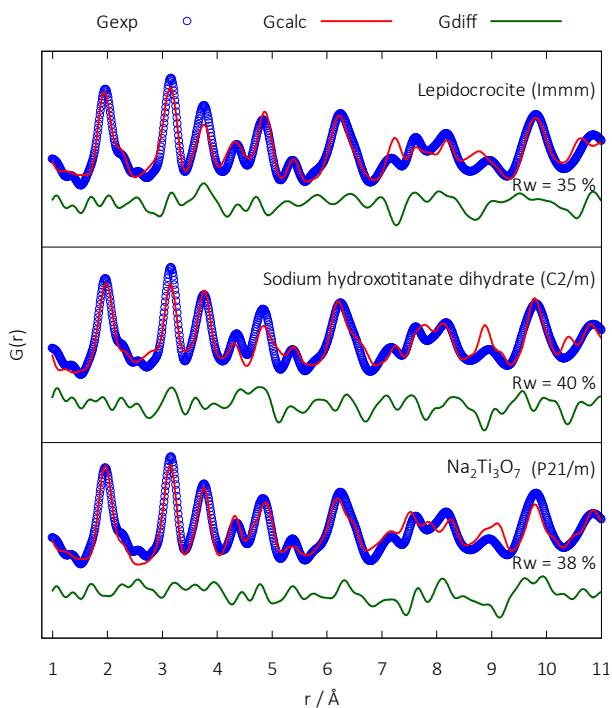

**Fig. S1.** Structural representation of a) lepidocrocite and b) trititanate structure.

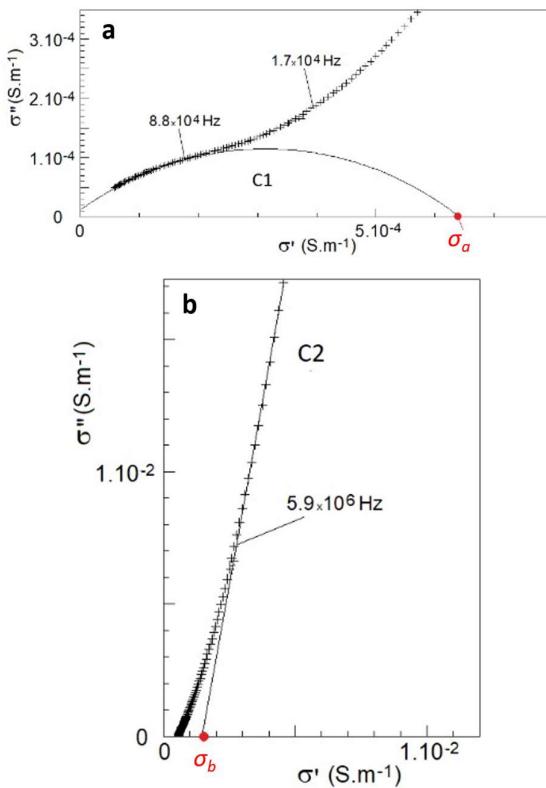

**Fig. S2.** ATR FT-IR spectrum of Na-titanate.

**Fig. S3.** Thermogravimetric analysis curve of Na-titanate.

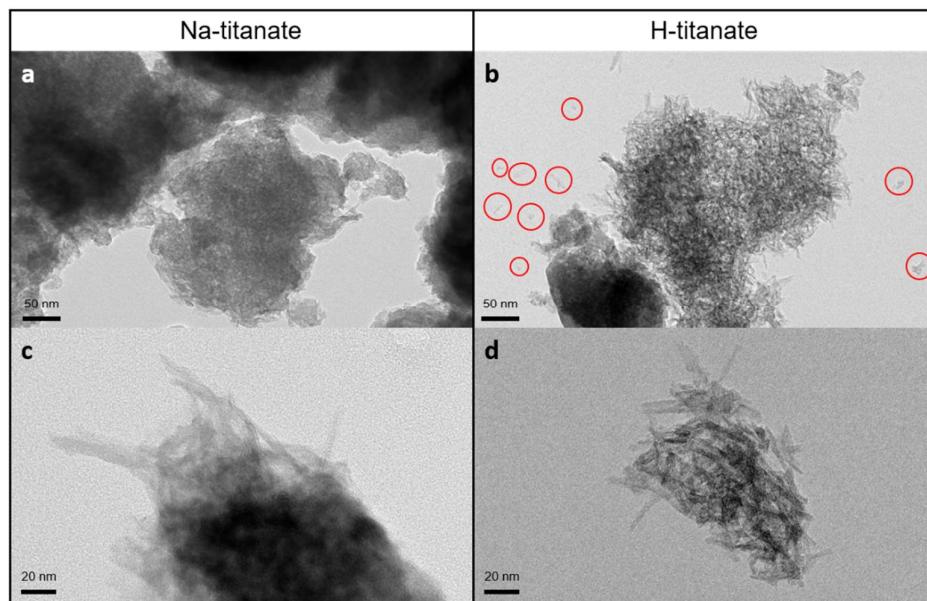

**Fig. S4.** PDF refinements of Na-titanate using different structural models.

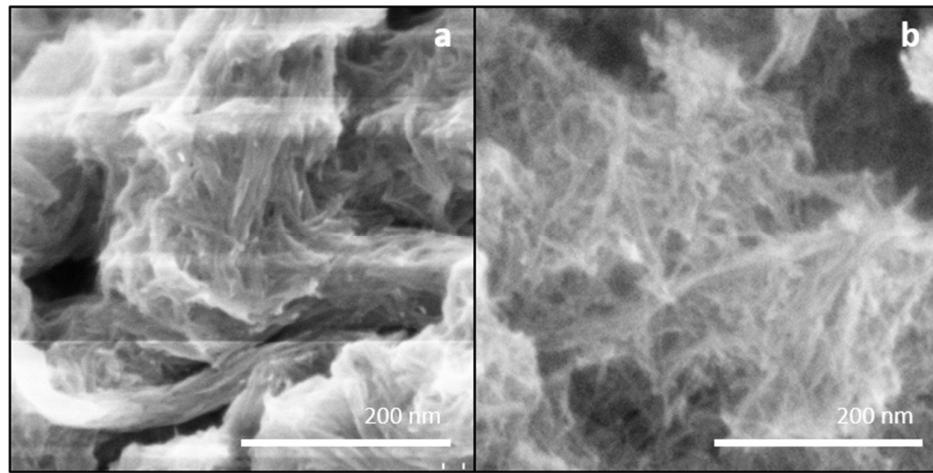

**Fig. S5.** Nyquist plots of conductivity at RT.

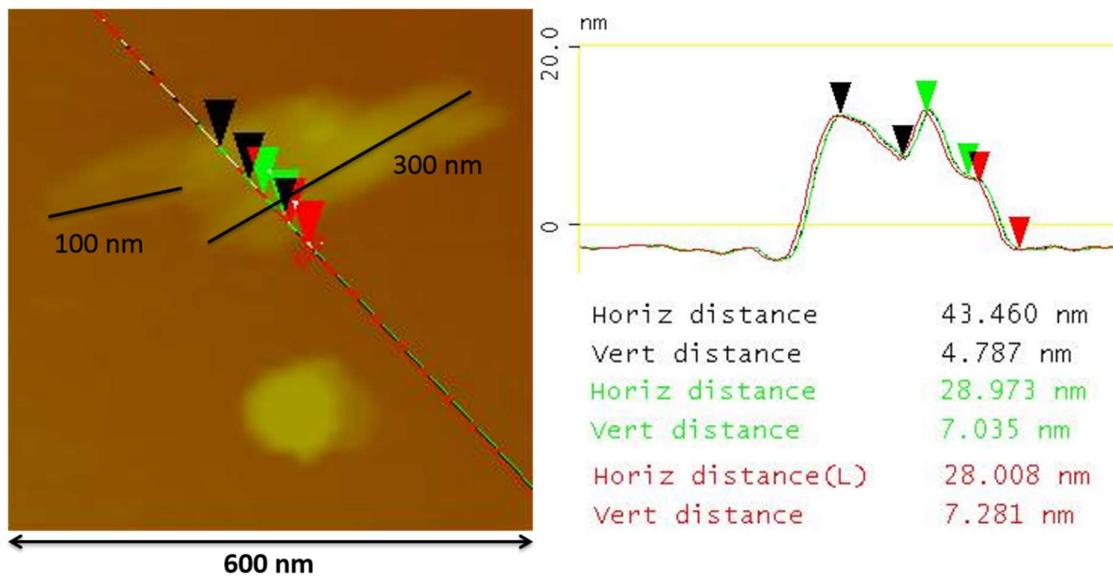

- a) Low-frequency contribution (double layer capacitance) C1 fitted with a circular arc.
  - b) Grain bulk contribution fitted with a straight line obtained after the subtraction of C1.
- $\sigma_a = 6.4 \cdot 10^{-4} \text{ S/m}$  and  $\sigma_b = 1.5 \cdot 10^{-3} \text{ S/m}$  are sample and grain conductivities, respectively.

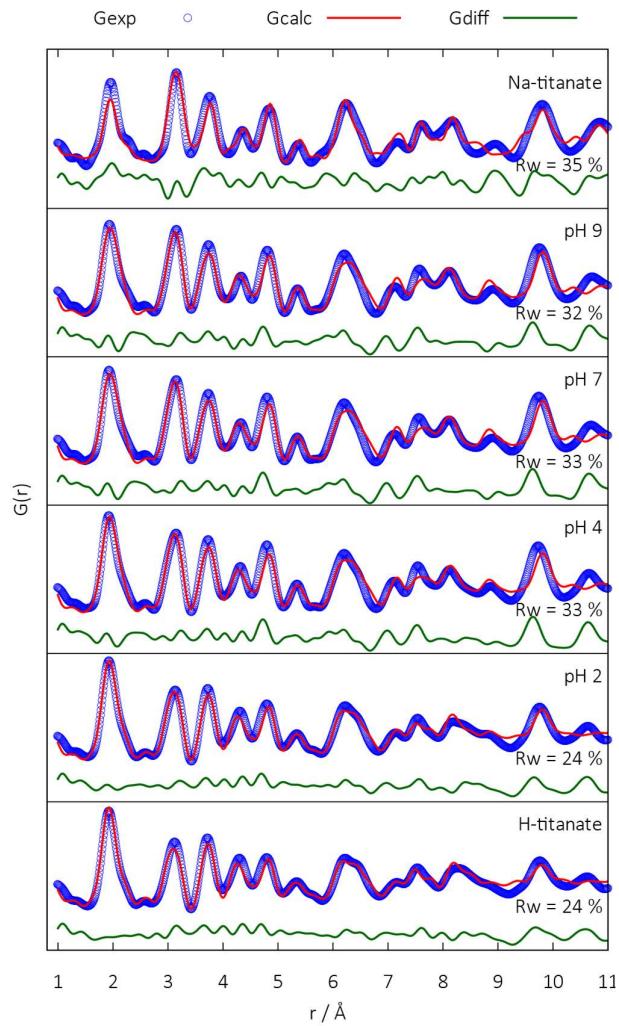

**Fig. S6.** TEM images of Na-titanate (a, c) and H-titanate (b, d).

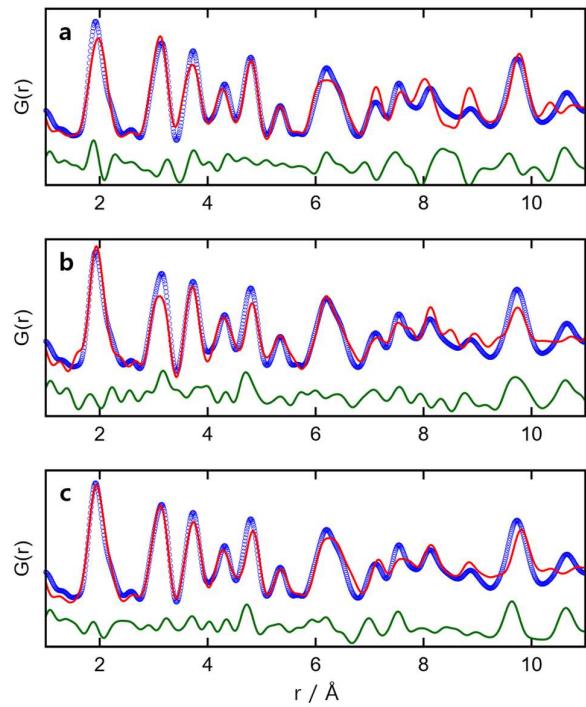

**Fig. S7.** SEM images of Na-titanate (a) and H-titanate (b)

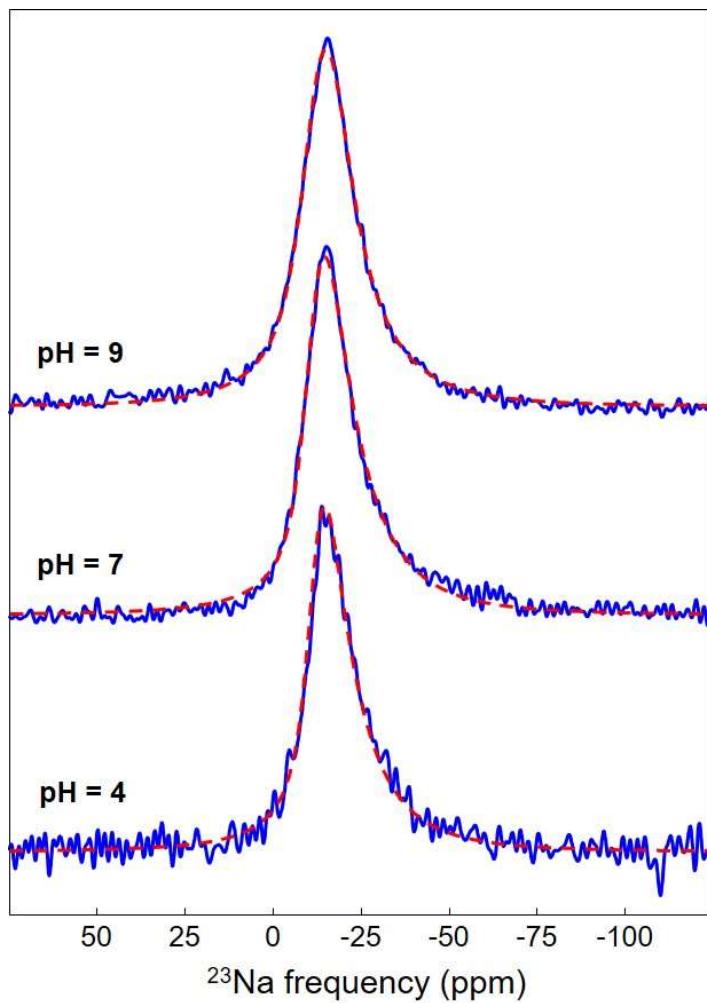

**Fig. S8.** Atomic force micrograph with a section of an aggregate of elongated particles of H-titanate. Horizontal and vertical distances are between black, green, and red arrows. The longest sizes of two elongated particles are given in the picture.

**Fig. S9.** Real-space refinements of the PDFs of the samples collected at different pH values.

**Fig. S10.** Real-space refinements of the PDF of the sample collected at pH 4 using lepidocrocite (a), trititanate (b), and both models (c).

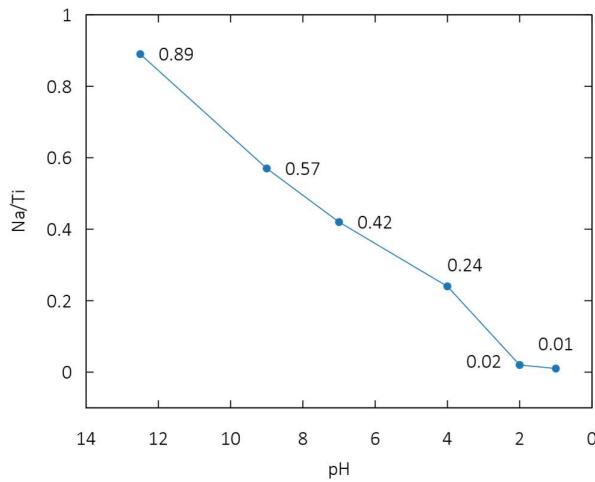

**Fig. S11.** Experimental (blue) and fitted using the Gaussian Isotropic Model<sup>1</sup> (red dashed line)<sup>23</sup>Na MAS (44 kHz) NMR spectra of three samples collected at different pH values. This model involves a Gaussian distribution of chemical shifts and a distribution of quadrupolar interactions. The parameters used for these fits are reported in **Table S1**.

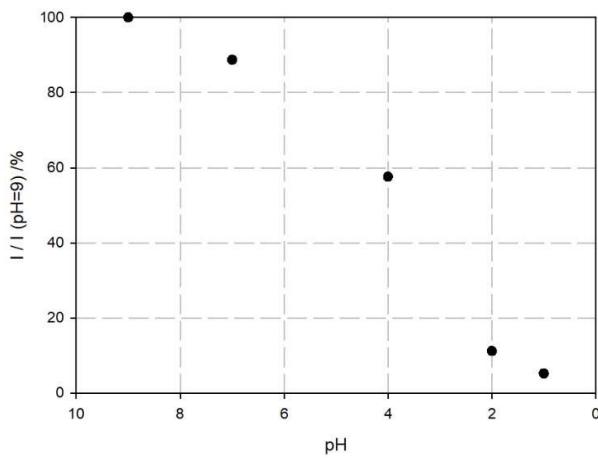

**Table S1.** Average isotropic chemical shift ( $\langle \delta_{\text{so}} \rangle$ /ppm), full width at half maximum (FWHM) of the isotropic chemical shift Gaussian distribution ( $\Delta \text{CS}$ /ppm), average quadrupolar frequency ( $\langle \nu_Q \rangle$ /kHz) and quadrupolar constant ( $\langle C_Q \rangle$ /MHz) used to fit the <sup>23</sup>Na MAS NMR spectra of three samples collected at different pH values (see **Fig. S8**).

pH	$\langle \delta_{\text{so}} \rangle$	$\Delta \text{CS}$	$\langle \nu_Q \rangle$	$\langle C_Q \rangle$
9	-12.6	9.1	515	1.03
7	-11.3	7.0	668	1.34
4	-11.7	5.8	631	1.26

**Fig. S12.** Na/Ti ratio quantified using energy dispersive X-ray spectroscopy for the samples collected at different pH.

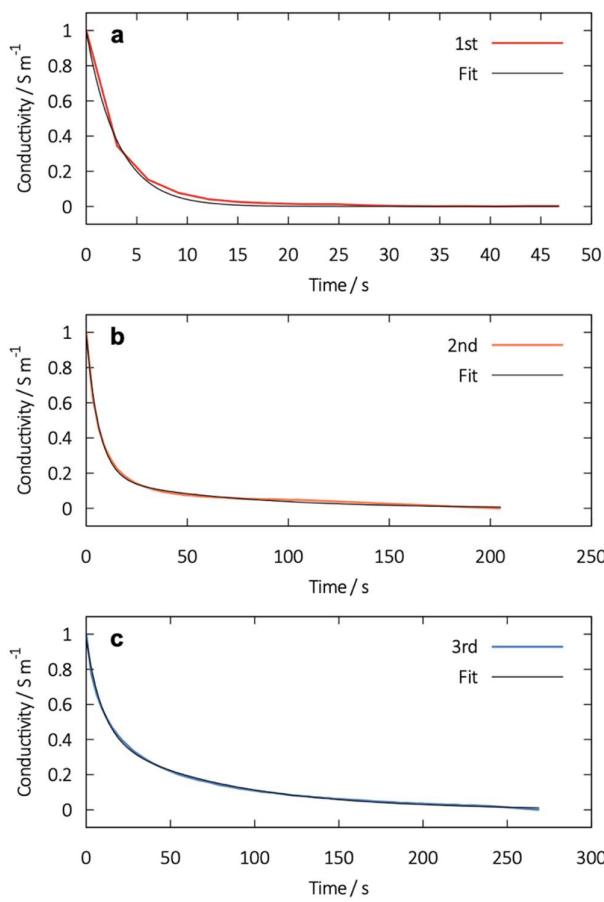

**Fig. S13.** Intensity / Intensity (pH = 9) ratio of the  $^{23}\text{Na}$  non-normalized NMR spectra for the samples collected at different pH. Intensity estimated as the area under the curve of the fit of each non-normalized spectrum. The  $^{23}\text{Na}$  non-normalized spectra correspond, for each sample, to the same number of scans and the same sample mass in the rotor.

**Fig. S14.** Experimental (blue) and fitted (red dashed line)  $^1\text{H}$  MAS (60 kHz) NMR spectra of the samples collected at different pH. The individual resonances used for these fits are shown below (see **Table S2**).

**Table S2.** Isotropic chemical shifts ( $\delta_{\text{iso}}$ /ppm), line widths (LW/ppm), relative intensities (I/%), of the NMR resonances used for the fit of the  $^1\text{H}$  MAS (64 kHz) NMR spectra of the samples collected at different pH (see Fig. S11).

pH	$\delta_{\text{iso}}$	LW	I
1	0.85	0.13	0.4
	1.26	0.31	1.3
	6.3	2.3	84.9
	8.1	5.7	13.4
2	0.92	0.14	0.6
	1.35	0.36	1.3
	5.9	1.6	60.3
	7.2	7.3	37.5
	11.4	1.5	0.3
4	0.85	0.14	0.5
	1.25	0.34	1.0
	5.2	1.5	74.6
	6.5	9.1	23.9
7	0.84	0.12	0.7
	1.24	0.28	1.4
	5.0	1.5	73.5
	5.3	5.3	24.4
9	0.86	0.13	0.6
	1.28	0.20	1.0
	1.8	0.09	0.3
	5.1	1.6	74.5
	6.0	5.4	23.6

**Fig. S15.** Results of to fit the decay of the ionic conductivity during the  $\text{Na}^+$ - $\text{H}^+$  ionic exchange.
