3. Cartesian coordinates and associated energies ..... S10

## 1. Transition states in the reaction pathways

The structures of transition states in reaction pathways shown in Schemes 3-8 are presented below. The imaginary vibrational frequency ( $\nu^\ddagger$ ,  $i \text{ cm}^{-1}$ ) and atomic distances ( $\text{\AA}$ ) of the corresponding transition state are also given.

**Figure S1.** Transition states for the reaction pathways shown in Scheme 3.

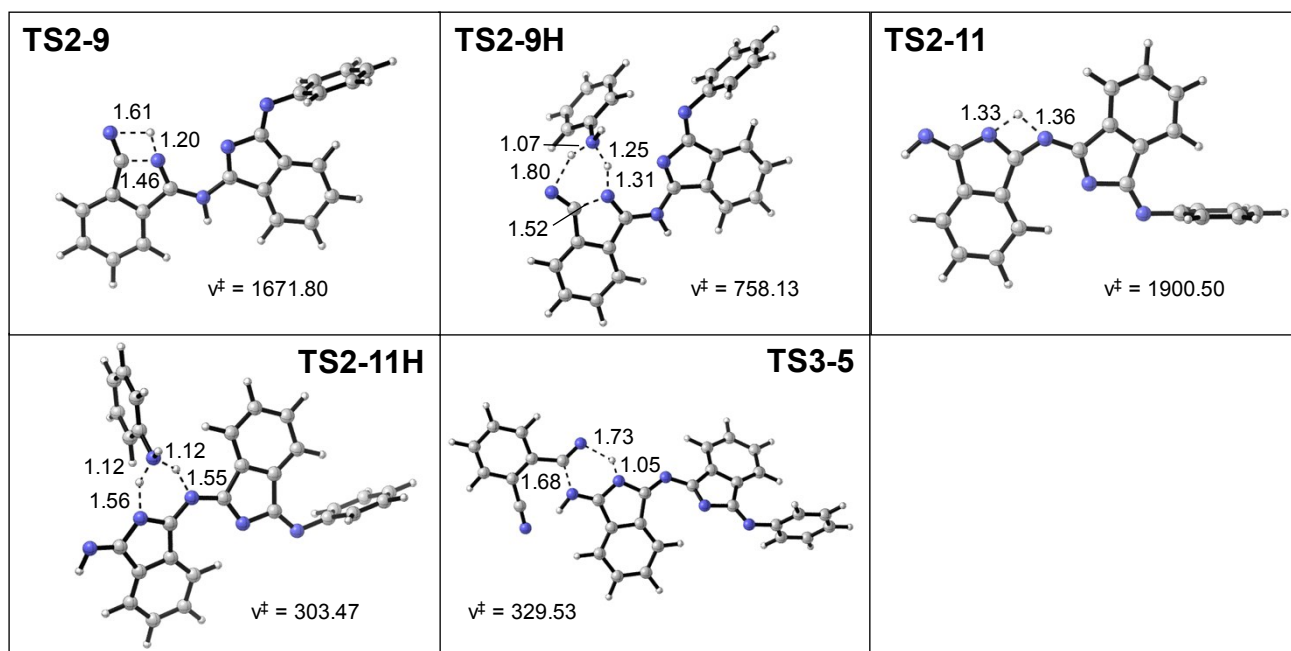

**Figure S2.** Transition states for the reaction pathways shown in Scheme 4.

**Figure S3.** Transition states for the reaction pathways shown in Scheme 5.

**Figure S4.** Transition states for the reaction pathways shown in Scheme 6.

**Figure S5.** Transition states for the reaction pathways shown in Scheme 7.

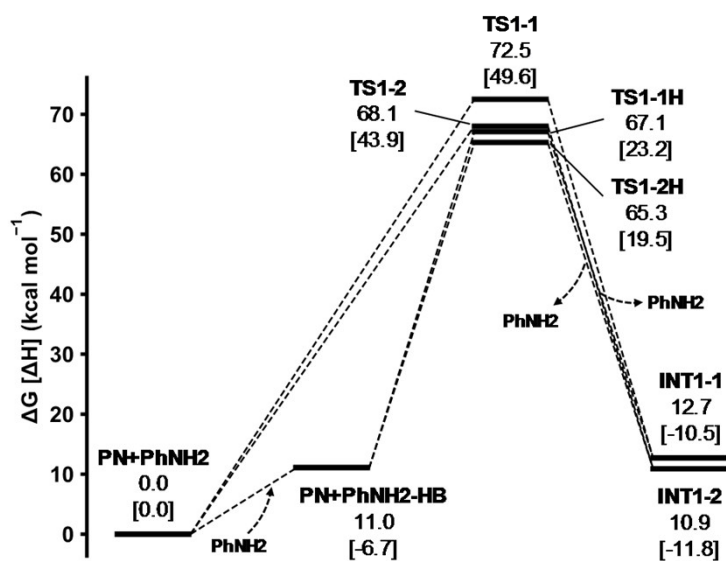

**Figure S6.** Transition states for the reaction pathways shown in Scheme 8.

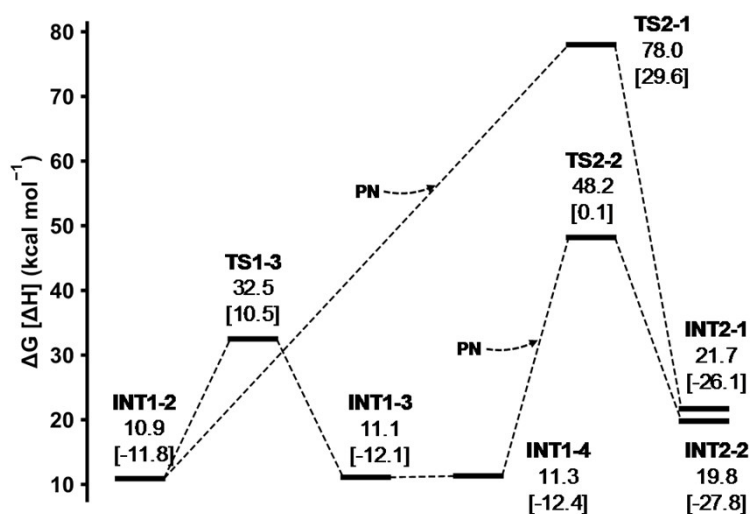

## 2. Free energy surfaces based on the uncorrected free energies in the gas phase

As the entropic contributions to the relative free energies estimated by the ideal gas model were overestimated, the uncorrected activation free energies in the gas phase for bimolecular reaction seem too high to be overcome, as can be seen from Figures S7-S12. It implies that the correction for the free energies of activation is necessary to obtain a reasonable result in kinetics. Nevertheless, the qualitative picture from the uncorrected free energy surfaces is similar to that from the corrected free energy surfaces shown in the text.

The curing of resins is usually an exothermic reaction. The relative enthalpies are also given to understand the heat release of reaction and guide the curing of larger and thick composites. One can see that the formation of triazine is exothermic by 59.3 kcal mol<sup>-1</sup> (see Figure S9), and the formation of phthalocyanine is exothermic by 101.2 kcal mol<sup>-1</sup> (see Figure S12). In other words, the heat releases of forming thiazine and phthalocyanine are exothermic by 19.8 kcal and 25.3 kcal per mole of consuming phthalonitrile monomers, respectively. It implies that the curing reaction forming cross-links of triazine has a lower exothermic effect, which is more favorable for phthalonitrile resins to be used in thick composite parts.

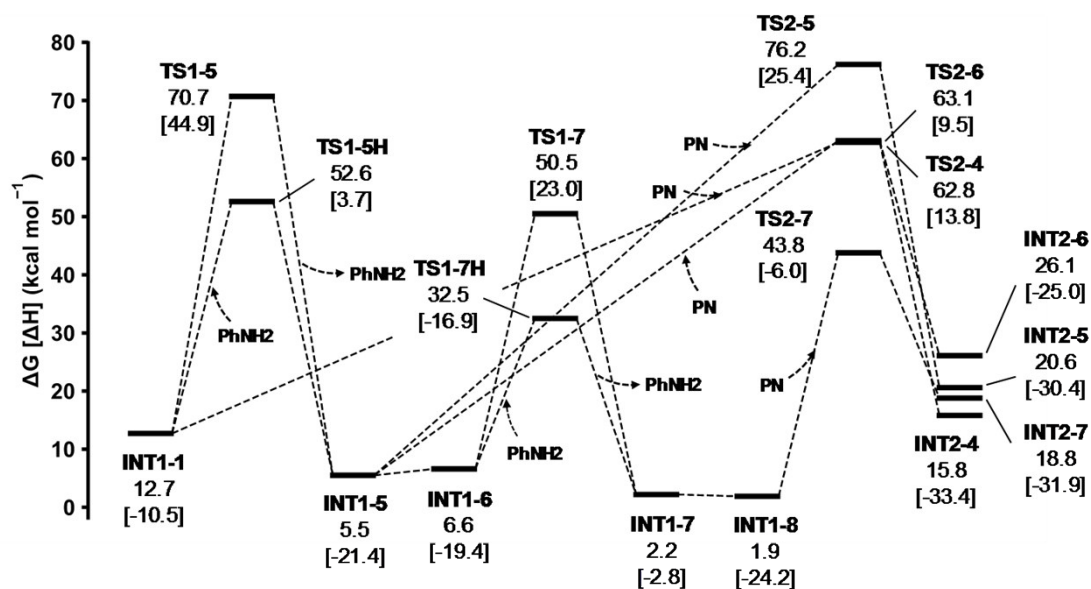

**Figure S7.** Free energy surfaces of the nucleophilic addition of aniline **PhNH<sub>2</sub>** or its hydrogen bonding complex **PhNH<sub>2</sub>-HB** to nitrile group on phthalonitrile **PN**.  $\Delta G$  presents the relative free energy in the gas phase without correction. Relative enthalpies are given in brackets.

**Figure S8.** Free energy surfaces of the reaction pathways from amidine intermediate **INT1-2**.  $\Delta G$  presents the relative free energy in the gas phase without correction. Relative enthalpies are given in brackets.

**Figure S9.** Free energy surfaces of the formation of triazine from amidine intermediate INT2-2.  $\Delta G$  presents the relative free energy in the gas phase without correction. Relative enthalpies are given in brackets.

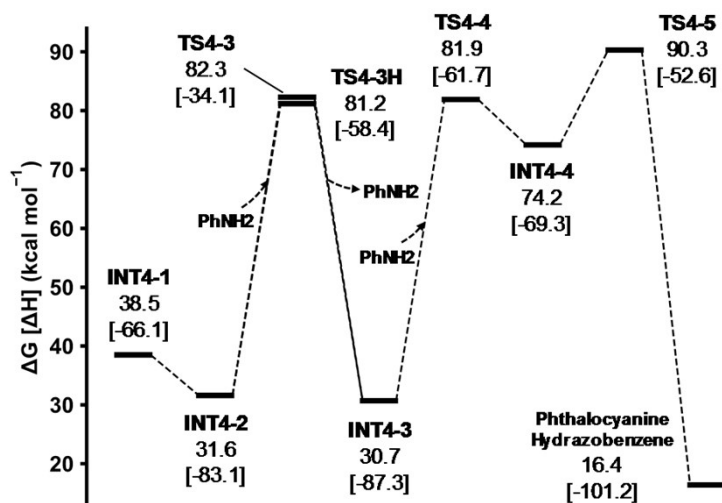

**Figure S10.** Free energy surfaces of the reaction pathways from amidine intermediate INT1-1.  $\Delta G$  presents the relative free energy in the gas phase without correction. Relative enthalpies are given in brackets.

**Figure S11.** Free energy surfaces of the formation of phthalonitrile tetramer **INT4-1** from amidine intermediate **INT2-7**.  $\Delta G$  presents the relative free energy in the gas phase without correction. Relative enthalpies are given in brackets.

**Figure S12.** Free energy surfaces of the formation of phthalocyanine from amidine intermediate **INT4-1**.  $\Delta G$  presents the relative free energy in the gas phase without correction. Relative enthalpies are given in brackets.

### 3. Cartesian coordinates and associated energies

All calculations were performed using the density functional M06-2X with a D3 dispersion correction. The structures of all reactants, products, intermediates, and transition states were fully optimized with the 6-31G(d,p) basis set in the gas phase. The electronic energies of optimized structures were refined with the larger basis set of 6-311+G(d,p). All thermal dynamic contributions were computed at 260 °C. The Cartesian coordinates of all optimized structures and the associated energies derived from the Gaussian 09 program package are as follows.
