Structure and energetics of $(C_{60}X)^-$

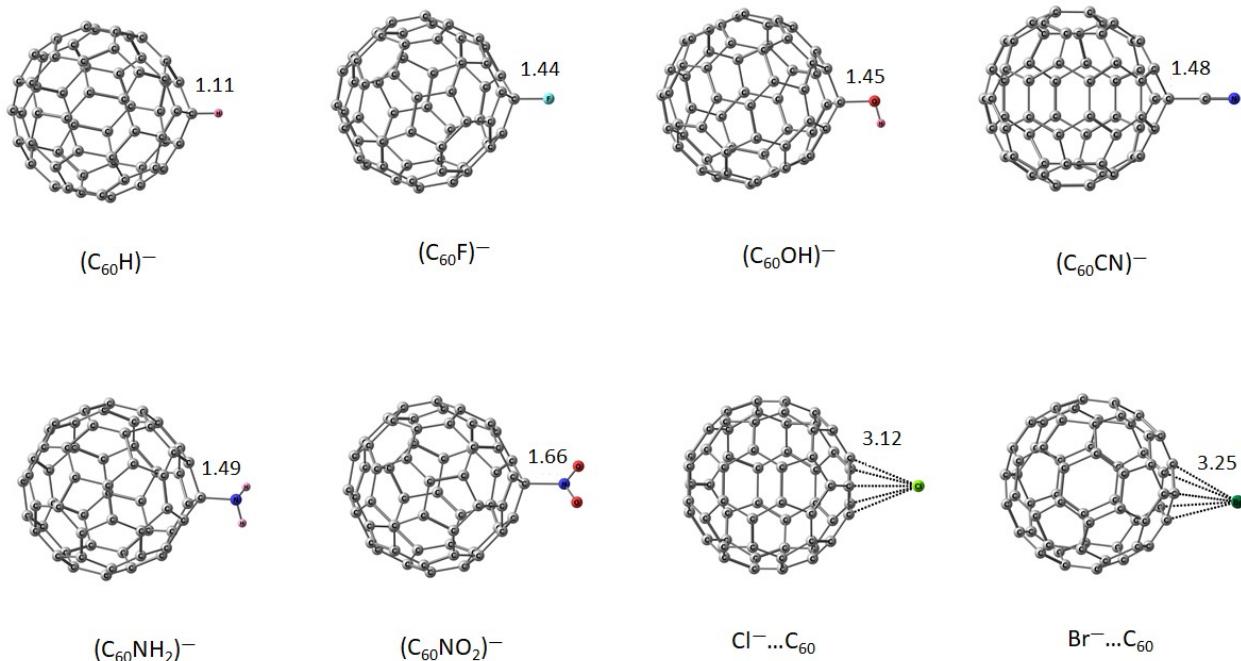

Fig. S1 Optimized geometries of X-fullerides and $X^- \dots (C_{60})$ at the M06L/6-31G(d,p) level with their local-minimum distances in Å.

The optimized geometries of X-fullerides ($X = H, F, OH, CN, NH_2$, and NO_2), with their respective C – X distance, are given in Fig. S1. The smallest anion (H^-) is found to interact with the fullerene ring at the shortest interaction distance (d_{int}) 1.11 Å, which indicates the formation of a strong C-H covalent bond. Similarly, for the anions *viz.* F^- , OH^- , CN^- , NH_2^- , and NO_2^- the d_{int} observed is 1.44 Å, 1.45 Å, 1.48 Å, 1.49 Å, and 1.66 Å, respectively suggesting strong C-X covalent bond formation in all. The C-X bond features observed for these $(C_{60}X)^-$ are very much similar to that observed for the $IM^+ \dots (C_{60}X)^-$ ion-pairs. This shows that the anionic exohedral modifications are only weakly influenced by IM^+ and the X-fullerides can be isolated as independent large anions. In the case of Cl^- and Br^- , multiple C atoms of the fullerene cage are found to interact with the halide with average d_{int} 3.12 Å and 3.25 Å, respectively. The QTAIM analysis (Table S6) also shows that the ρ_b values for the C-X bond are in the range of 0.2131 to 0.2651 au for $X = H, F, OH, CN$, and NH_2 , indicate the covalent nature of the C-X bond. While in the case of $X = NO_2$, the value is 0.1777 indicates a weak covalent bond interaction between C_{60} and NO_2 . The energy required for the dissociation of $(C_{60}X)^-$ into C_{60} and X^- (E_d) ranges from 97 to 33.5 kcal/mol for $X = H, F, OH, CN, NH_2$, and NO_2 (Table S1).

These results propose that irrespective of the nature of the anion, $(C_{60}X)^-$ may exist as a chemically stable anionic entity. Very similar features were observed for $X^-@C_{60}$ systems.⁵³ Whereas the dissociation energy values observed for $X = Cl$ and Br are 24.4 and 22.7 kcal/mol respectively, shows that $Cl^-...C_{60}$ and $Br^-...C_{60}$ exist as noncovalent complexes of fullerene as observed in the ion-pair $(IM^+...X^-)...C_{60}$, for $X = Cl$ and Br . Here $C...X$ interaction is completely noncovalent in nature and the anionic character remains in the halides itself.

The energy for dissociation (E_d) of each $(C_{60}X)^-$ into C_{60} and anion X^- is calculated as

$$E_d = (E_3 + E_8) - E_5 \quad (1)$$

where E_3 , E_5 and E_8 stand for the ZPE-corrected energy of $(C_{60}X)^-$, C_{60} and anion X^- . The free energy associated with the dissociation reaction (G_d) is also calculated in a similar fashion.

Table S1. ZPE-corrected E_d and G_d values (kcal/mol) of X-fullerides at the M06L/6-311++G(d,p)//M06L/6-31G(d,p) level.

| System | E_d (kcal/mol) | G_d (kcal/mol) |
