2. Accuracy of basis sets and functional

The accuracy of the basis sets (ECP) has been tested for the whole catalytic cycle 1 i.e., the conversion of CO₂ to MF for both the Co and Ru-triphos catalysts using a larger triple-zeta + polarization quality basis set def2-TZVP for Co and Ru and 6-31++G(d,p) basis set for the main group elements (C, H, O and P). Likewise, the accuracy of the functional has also been tested using M06 functional for some those selected steps (TS1 for Co and Ru-triphos catalysts). The calculated free energy barriers with different functional (M06) and basis set [def2-TZVP for Co and Ru and 6-31++G(d,p) for light elements] are in quite agreement with a difference of 1-2.3 kcal/mol.

Table S1: Accuracy of basis sets (ECP): calculated reaction free energies of the transfer hydrogenation reaction for the conversion of CO₂ to MF using Ru and Co-triphos catalyst with B3LYP functional 6-31++G(d,p) Pople diffused basis set and def2TZVP ECP. $\Delta\Delta G^\ddagger$ is the total reaction free energy barrier for reaction. All the energy values are in kcal/mol.

15. Microkinetic model

Text S1. The microkinetic modeling has been evaluated considering the Livermore Solver for Ordinary Differential Equations (LSODA) algorithm as employed in the Complex Pathway Simulator (COPASI) software (version 4.24).^{1,2} Here, in this microkinetic modeling, we have only considered the most favorable pathways for the conversion of CO₂ to DMM via HCOOH, methyl formate (MF) and methoxy methanol (MM) using the Co-triphos catalyst. To consider the dimerization steps which are going through barrier less, the rate constants have been calculated by the diffusion-controlled method using the rate constant equation given by $k=800k_BT/3\eta$ where k_B is the Boltzmann constant, T is the temperature, and η is the viscosity of the solvent considered.^{3,4} The diffusion-controlled rate constant value has been calculated at 298.15 K with the viscosity of THF at 298.15 while all other rate constants have been calculated at 373.15 K. Further to mimic the experimental environment we have considered all the experimental conditions. We have considered the catalyst concentration of 0.0125 mmol and varied the concentration of gaseous reactants (CO₂ and H₂) for the time course of 48 hours and evaluated the effect of concentration of the gaseous molecules on the product formation.⁵
