^a The relative integrated intensity for each resonance is normalised to the sum of all sites within the reaction product and is obtained by simulating the ^{29}Si MAS NMR spectra. Estimated error in the relative integral area is 1%. ^b The Si/Al of the N-A-S-H gel is calculated using Engelhardt's formula³⁹ and the relative integral areas of the Q⁴(mAl) resonances.

Appendix B – Thermodynamic data for the sodium alkali aluminosilicate gels

Table S2: The ionic coefficients, ionic activities and total ionic strength of ionic species calculated according to Eq. 1 to Eq. 3, using the experimentally measured concentration shown in Figure 8 as input. The only ionic species allowed to form in these systems are: Na^+ , AlO_2^- , $\text{SiO}_2@$, OH^- , including trace of K^+ .

Sample ID	Ionic coefficient (γ)					Ionic activity mmol/L					Total ionic strength (mol/kg-H ₂ O)
	Na^+	AlO_2^-	$\text{SiO}_2@$	OH^-	K^+	Na^+	AlO_2^-	$\text{SiO}_2@$	OH^-	K^+
