The calculation formula of Li transference number is as follows:

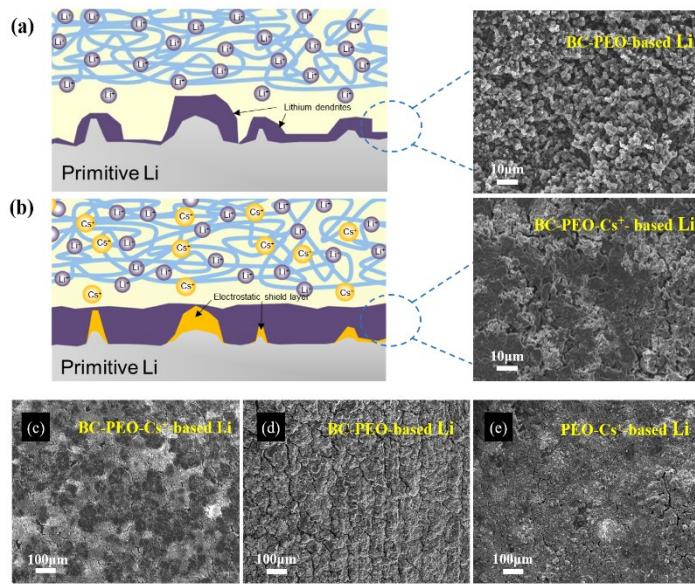

$$t_{\text{Li}^+} = \frac{I_s(\Delta V - I_0 R_l^0)}{I_0(\Delta V - I_s R_l^s)}$$

where  $\Delta V$  is the applied voltage (10 mV),  $I_0$  and  $I_s$  are the initial current and steady current, respectively, during DC polarization process.  $R_l^0$  and  $R_l^s$  are the charge-transfer resistances of Li symmetric cell before and after DC polarization, respectively.
