## 1. Experimental procedures

General Procedures: All chemicals were purchased from Sigma-Aldrich, Nacalai Tesque and Wako Pure Chemical Industries. All reagents and solvents were used as received. $c i s-\left[\mathrm{Pt}(\mathrm{bisNHC}-\mathrm{C} 2)(\mathrm{SH})_{2}\right]($ bisNHC-C2 $=$ 1,1'-Dimethyl-3,3'-ethylene-4-diimidazolilydene) was prepared according to the reported procedures. ${ }^{1}$ cis$\left[\mathrm{Pt}(\right.$ bisNHC-C2 $\left.) \mathrm{Cl}_{2}\right]$ was synthesised from the reaction of $\mathrm{K}_{2}\left[\mathrm{PtCl}_{4}\right]$ and $\left[(\mathrm{bisNHC}-\mathrm{C} 2) \mathrm{H}_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ in DMSO using a previously reported procedure. ${ }^{11} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AVANCE 400 or 600 FTNMR spectrometers. Chemical shifts ( $\delta$ in ppm, coupling constants $J$ in Hz ) for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals are expressed from $\mathrm{SiMe}_{4}$ and referenced to residual solvent resonances. Elemental analyses were performed on a JScience Lab JM-10 elemental analyser by the Analytical Research Centre at Osaka City University.

## Synthesis of $\left[\mathbf{P t}(\right.$ bisNHC-C2 $)\left(\mathrm{NCMe}_{2}\right)_{2}\left(\mathrm{PF}_{6}\right)_{2}$

A solution of $\mathrm{AgPF}_{6}(1.04 \mathrm{~g}, 4.12 \mathrm{mmol})$ in $\mathrm{MeCN}(10 \mathrm{~mL})$ was added to a solution of cis-[ $\mathrm{Pt}($ bisNHC-C2 $\left.) \mathrm{Cl}_{2}\right]$ $(0.93 \mathrm{~g}, 2.04 \mathrm{mmol})$ in $\mathrm{MeCN}(30 \mathrm{~mL})$ to give a colourless solution with a white solid of AgCl . After the mixture was stirred for 3.5 h , the white solid was removed by centrifugation three times to give a colorless solution. The solvent was removed under reduced pressure to afford a white residue. The residue was re-dissolved in MeCN (15 mL ) and insoluble white solids were removed by filtration using a membrane filter. The solvent was removed under reduced pressure to give a crude product of $\operatorname{cis}-\left[\mathrm{Pt}(\right.$ bisNHC-C2 $\left.)(\mathrm{NCMe})_{2}\right]$ as a white solid. Recrystallisation of the crude product twice from a solution in MeCN by the addition of $\mathrm{Et}_{2} \mathrm{O}$ to give colourless microcrystals. Yield: $1.43 \mathrm{~g}, 93 \%$. Anal. A single crystal of $[4]\left(\mathrm{PF}_{6}\right)_{6} \cdot 2 \mathrm{MeOH}$ was mounted on a loop using Paratone. Diffraction data were collected on a Rigaku Varimax Saturn724 diffractometer using a rotation method with $0.5^{\circ}$ frame widths. The data were integrated, scaled, sorted, and averaged using the CrystalClear ${ }^{2}$ software. Absorption corrections were applied using the multi-scan method. The structures were solved using SHELXS973 ${ }^{3}$ and refined with SHELXL Version 2018/3 ${ }^{4}$ using the CrystalStructure software. ${ }^{5}$ All hydrogen atoms were located at the calculated positions and refined as riding models. Crystallographic data are summarised in Table S1.
