General Procedure for Asymmetric allylic substitution reactions

Pd-catalysed allylic alkylation of rac-(E)-3-acetoxy-1,3-diphenyl-1-propene (S2)

Under a nitrogen atmosphere, the appropriate Pd complex (0.25·10^{-2} mmol), substrate rac-(E)-3-acetoxy-1,3-diphenyl-1-propene, (0.5 mmol) and sodium dimethyl malonate (0.75 mmol) were dissolved in dichloromethane (4 mL) in this precise order. The flask was covered with aluminium foil, and the mixture was stirred for the allotted time. To quench the reaction, diethyl ether (20 mL) and aqueous 10% ammonium chloride solution (20 mL) were added. After extraction, the organic phase was dried with anhydrous sodium sulphate, filtered and the solvent was removed in vacuo. The crude product was analysed by \(^1\)H NMR spectroscopy to estimate the conversion. Afterwards, the crude product was dissolved in ethyl acetate, and the solution was purified through a column of silica to remove the metallic impurities. The eluent was then removed in vacuo and the residue was analysed by NMR spectroscopy and HPLC. In all cases, 10 mg of product were dissolved in 20 mL of the eluent and subsequently filtered before the injection of the sample in the HPLC. The specific conditions are depicted in Table S1.

Pd-catalysed allylic alkylation of rac-1,3-dimethyl-3-acetoxy-1-propene (S3) and rac-3-acetoxycyclohexene (S4)

Under a nitrogen atmosphere, the appropriate Pd complex (0.25·10^{-2} mmol), substrate (1 mmol), dimethyl malonate (3 mmol), N,O-bis(trimethylsilyl)acetamide (BSA) (3 mmol) and potassium acetate (0.01 mmol) were dissolved in dichloromethane (4 mL) in this precise order. The flask was covered with aluminium foil, and the mixture was stirred for the allotted time. To quench the reaction, diethyl ether (20 mL) and aqueous 10% ammonium chloride solution (20 mL) were added. After extraction, the organic phase was dried with anhydrous sodium sulphate, filtered and the solvent was removed in vacuo. The crude product was analysed by \(^1\)H NMR spectroscopy to estimate the conversion. Afterwards, the crude product was dissolved in ethyl acetate, and the solution was purified through a column of silica to remove the metallic impurities. The eluent was then removed in vacuo and the residue was analysed by NMR spectroscopy and GC. The specific conditions for the GC analysis are depicted in Table S2 and S3.
