Supplementary Information:

Membrane fouling characteristics of membrane bioreactor (MBR) under salinity shock: Extracellular Polymeric Substances (EPS) and optimization of operating parameters

☆ EPS extraction method

EPS can be divided into soluble EPS (S-EPS, or SMP) and adhesive EPS (B-EPS), and the latter can be divided into loosely attached EPS (LB-EPS) and tightly attached EPS (TB-EPS). Using heating extraction method, the steps are as follows:

At the end of each experimental stage, 10 mL of sludge adhered to the membrane was enriched, added with 0.01 M NaCl buffer solution and centrifuged at 4 $^{\circ}\mathrm{C}$ 550 r/min for 15 min, and the supernatant was filtered through 0.45 µm organic microfiltration Membrane to obtain the SMP solution; add 0.01 M NaCl buffer to the remaining sludge to resuspend to the original volume, sonicate for 2 min, centrifuge at 4 °C 9000 r/min for 20 min, the supernatant is over 0.45 µm organic LB-EPS is obtained by the microporous filter membrane; then add 0.01 M NaCl to the remaining sludge to resuspend the weight to the original volume, heat in a water bath at 70 °C for 40 min, and cool to room temperature at 4 °C at 20000 r/min Centrifuge for 20 min, and pass the supernatant through a 0.45 µm organic microporous membrane to obtain TB-EPS. At the same time, the concentration of sludge VSS was measured.

* Optimize the design of experimental operating parameters

The intermittent filtration cycle of the fixed reactor was continuous water output for 4 min, stop pumping for 1 min. When HRT was used as a variable, the fixed C/N was 3: 1, DO was 3.5 - 4.5 mg/L; When C/N was variable, fixed HRT was 24.0 h, DO was 2.0 - 3.0 mg/L; when DO was variable, fixed HRT was 24.0 h, C/N was 5:1. When the system runs stably under the conditions of various operating parameters, start membrane fouling rate determination experiment, and finally determine the content of extracellular secretions.

Table S1 Optimized test operation parameter design								
Operating parameters	Ι	II	III					
HRT /(h) (C/N = 3:1, DO = 3.5 ~ 4.5 mg/L)	12.0	16.0	24.0					
C/N (HRT = 24.0 h, DO = 2.0 ~ 3.0 mg/L)	3:1	5:1	8:1					
DO /(mg/L) (HRT = 24.0 h, C/N = 5:1)	0.5 ~ 1.5	2.0 ~ 3.0	3.5~4.5
