Supplementary texts

Typical LIPS spectra.

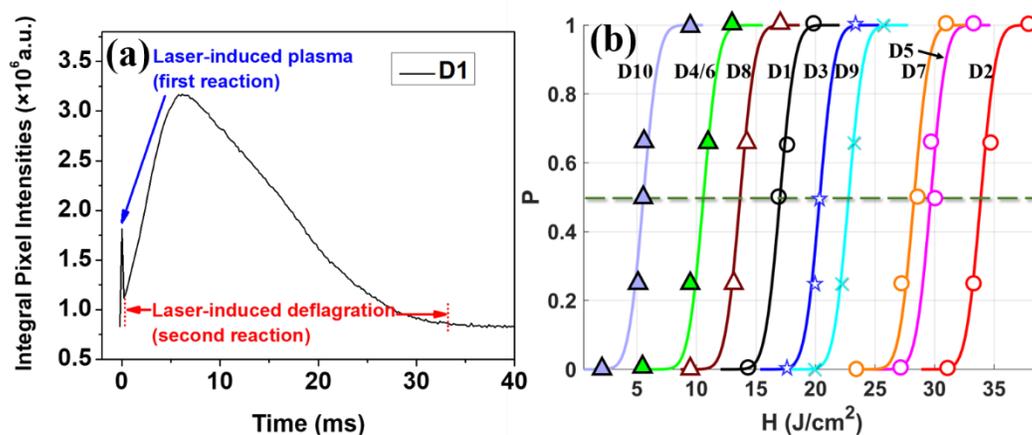

The main characteristic peaks including C (193.1 nm, 247.9 nm), H (656.3 nm), N (742.4 nm, 744.2 nm, 746.8 nm, 868 nm, 870.3 nm, 871.2 nm), O (unresolved triplet at 777.2 nm, 777.4 nm, 777.5 nm) as well as CN bands (358.7 nm, 388.2 nm) and weak C₂ band (516.5 nm) are involved. Peaks of some impurities, such as calcium and sodium are also observed. The emission from ambient argon is basically in the infrared band. All above elements are matched according to Atomic Spectra Database (ASD) of National Institute of Standards and Technology (NIST, see https://physics.nist.gov/PhysRefData/ASD/lines_form.html).
