1. H₂-H₂ interactions

In the present calculations, we have considered the weak van der Waals (vdW) interactions by incorporating semi-empirical Grimmes' “-D3” dispersion corrections. To compute the binding enthalpy with the dispersion effects, we have used the equation below:

$$\Delta H_{nH_2} = H_{(linker+nH_2)} - (H_{linker} + H_{nH_2})$$

Here, we have included the dispersion correction in every term. The dispersion interaction between the H₂ - H₂ molecules becomes more negative as the number of H₂ molecules increases in the system. The Grimme's dispersion interaction energies for the number of 2, 3, and 4 H₂ molecules are presented in Table S1 which indicates that the maximum and optimum H₂-H₂ dispersion energy can be -3.867 kJ/mol when the four number of H₂ physisorbed in the linkers. The value of ΔH may decrease due to the decreasing value of the dispersion energies (as more negative value of ΔH). We have calculated the dispersion energy for the H₂ complexes and found that the dispersion energy is one of the dominant factors in the weak interaction of H₂ molecules adsorbed in the linkers.

Table S1: The Grimme's dispersion interaction energies for the 2H₂, 3H₂, and 4H₂ molecules are reported.

H ₂ -H ₂	2H ₂	3H ₂	4H ₂
Dispersion Energy (kJ/mol)	-0.038	-2.422	-3.867

The Figure S1 a) shows the electrostatic potential map of H₂-H₂ molecules. The red color in the electrostatic potential map indicates the positive value of electrostatic potential whereas the blue color indicates the negative value of electrostatic potential. The Figure S1 b) shows the electrostatic potential contour plot of H₂-H₂ molecule. The denser area in molecular electrostatic potential contour lines represents the stronger electrostatic field than the region with less contour lines.

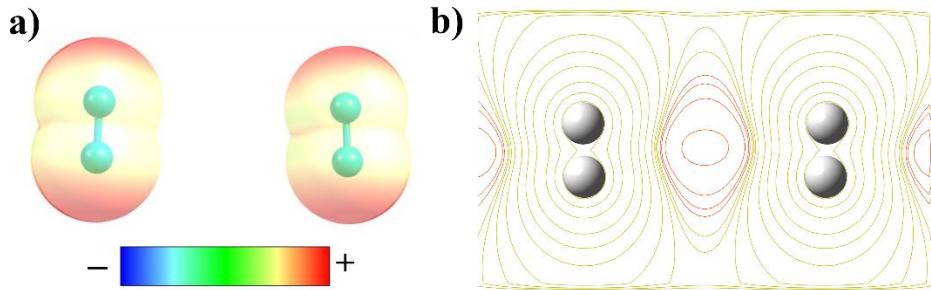

Figure S1: a) The electrostatic potential map of $\text{H}_2\text{-H}_2$ molecules and b) the electrostatic potential contour plot of $\text{H}_2\text{-H}_2$ molecule.

2. Different binding sites in the TM-chelated Linker-2:

The optimized equilibrium structure of the TM-chelated Linker-2 interacting with four H_2 molecules is shown in Figure S2. The numbers (near to the H_2 molecules) represent the sequence of the H_2 addition to the linker. Similarly, we chose the H_2 bindings at four different binding sites i.e., near to the transition metals of the TM-chelated linker, and at the BO_2C_2 ring, C_6H_4 ring, C_3N_3 ring of the pristine linkers.

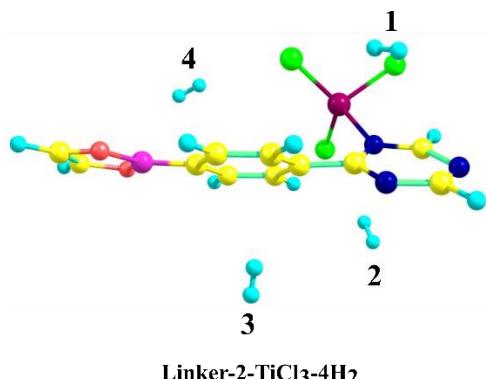

Figure S2: The optimized equilibrium structure of the TM chelated Linker-2 interacting with four H_2 molecules is shown here.

Among all the H_2 complexes, the Sc chelated linkers have the most stable configurations because these Sc-chelated linkers have low binding enthalpy. The stable configurations and equilibrium structure of the H_2 adsorbed complexes are shown in Figure S3. In the present calculations, we have observed that the Sc chelated Linker-5 has the lowest binding enthalpy during physisorption process when four H_2 molecules physisorbed.

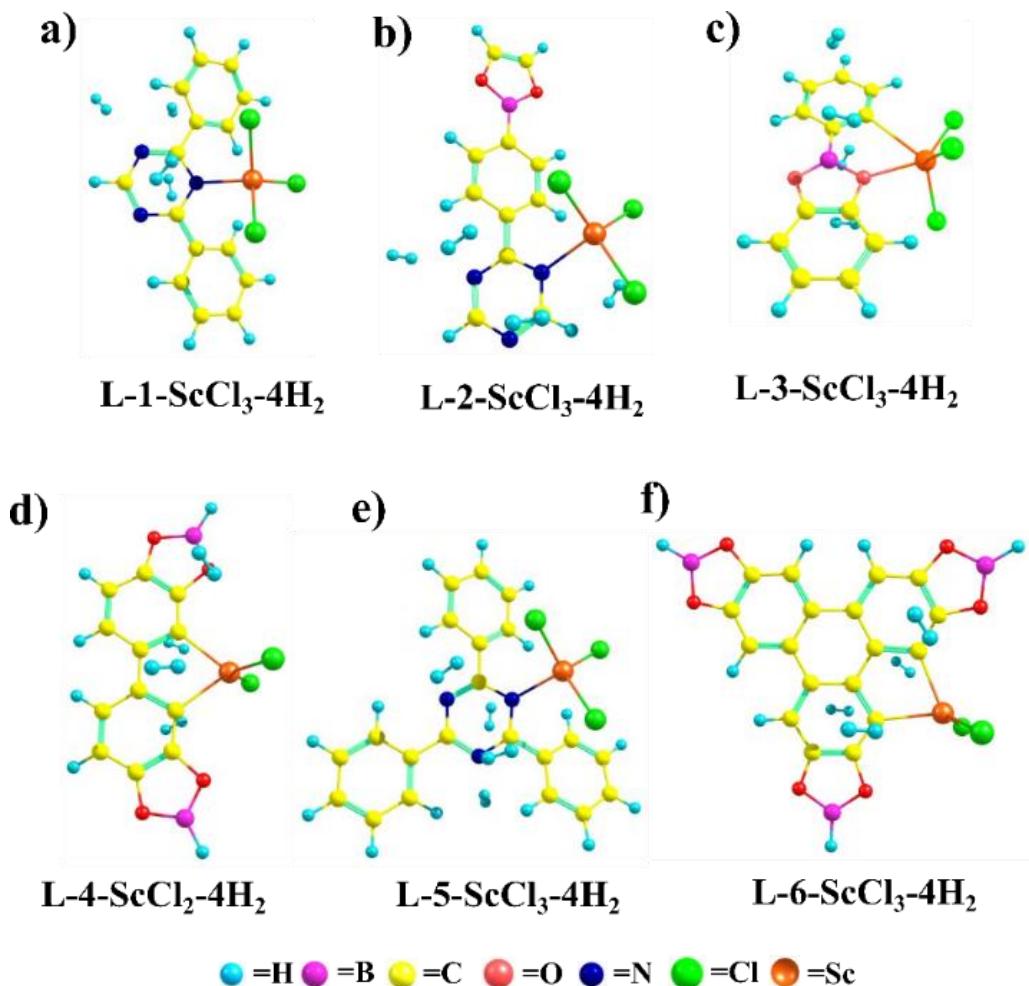

Figure S3: The equilibrium geometry of the physiosorbed four H_2 molecules; a) L-1- $\text{ScCl}_3\text{-}4\text{H}_2$ b) L-2- $\text{ScCl}_3\text{-}4\text{H}_2$ c) L-3- $\text{ScCl}_3\text{-}4\text{H}_2$ d) L-4- $\text{ScCl}_2\text{-}4\text{H}_2$ e) L-5- $\text{ScCl}_3\text{-}4\text{H}_2$ f) L-6- $\text{ScCl}_3\text{-}4\text{H}_2$.

In the case of pristine linkers, we have also studied the stable binding sites and their H_2 binding energy in terms of enthalpy computed here. To examine the different binding sites in a linker, we have chosen linker-2 because among all the linkers the Linker-2 has all the binding sites (i.e., BO_2C_2 ring, C_6H_4 ring, C_3N_3 ring). The binding enthalpies (ΔH) of H_2 molecules at different adsorption sites are tabulated in Table S2.

Table S2: The binding enthalpies (ΔH) of H_2 molecules adsorption at different binding sites in the Linker-2.

	H_2 binding at different adsorption sites		
H_2 Binding Enthalpy in kJ/mol	BO_2C_2	C_6H_4	C_3N_3
	-2.29	-1.72	-1.56

The present calculations reveal that H₂ molecules adsorbed at all the binding sites of a linker are in equilibrium thermodynamically and all the structures are energetically and thermodynamically stable. We found that all the H₂ binding sites are stable at room temperature as there was no imaginary or negative frequency present in the computations. We observed that among all the binding sites, the BO₂C₂ ring is the most favorable site for the H₂ adsorption. Figure S4 a-c) shows the different H₂ adsorption sites i.e. BO₂C₂ ring, C₆H₄ ring, C₃N₃ ring in Linkers 2.
