I: General Information

Commercially available materials purchased from Alfa Aesar or Sigma-Aldrich was used as received. Toluene and DCM was dried over Pure Solv solvent purification system. THF was distilled over sodium. Other solvents were dried over 4 \AA molecular sieve prior use. Proton nuclear magnetic resonance (^1H NMR) spectra were recorded on a Bruker (400 MHz) spectrometer. Chemical shifts were recorded in parts per million (ppm, δ) relative to tetramethylsilane (δ 0.00) or chloroform (δ = 7.26, singlet). ^1H NMR splitting patterns are designated as singlet (s), doublet (d), triplet (t), quartet (q), dd (doublet of doublets); m (multiplets), and etc. All first-order splitting patterns were assigned on the basis of the appearance of the multiplet. Splitting patterns that could not be easily interpreted are designated as multiplet (m) or broad (br). Carbon nuclear magnetic resonance (^{13}C NMR) spectra were recorded on a Bruker (400 MHz) (100 MHz) spectrometer. High resolution mass spectral analysis (HRMS) was performed on a Waters Q-TOF Premier Spectrometer. X-ray crystallography analysis was performed on Bruker X8 APEX X-ray diffractionmeter. Analytical thin-layer chromatography (TLC) was carried out on Merck 60 F254 pre-coated silica gel plate (0.2 mm thickness). Visualization was performed using a UV lamp or potassium permanganate stain.

b) General procedure for the reactions of 1 with 2 to synthesize product 3 (3a as an example):

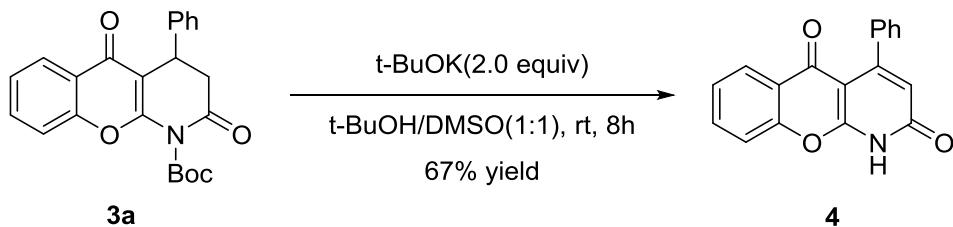

α -Bromocinnamaldehyde **1** was synthesized according to the literature.^[1]

Tert-butyl (4-oxo-4H-chromen-2-yl)carbamate **2** were synthesized according to the literature.^[2]

The reaction was operated in a glove box. To a flame-dried screw-capped tube equipped with a magnetic stir bar α -Bromocinnamaldehyde(31.6 mg, 0.15 mmol), tert-butyl (4-oxo-4H-chromen-2-yl)carbamate **2a** (26.3 mg, 0.10 mmol), DABCO(28.0 mg, 2.5 equiv.), NHC A(5.3 mg, 20 mol%), anhydrous 4Å MS(100 mg) and PhCl (2.0 mL) were added. The reaction mixture was stirred at 30°C until tert-butyl (4-oxo-4H-chromen-2-yl)carbamate **2a** disappeared (detected by TLC), and then directly applied to silica gel column chromatography (25% v/v ethyl acetate in hexane) to afford **3a** as a white solid in 88% yield.

c) Synthetic transformations

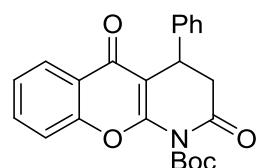

The reaction was operated in a glove box. To a flame-dried screw-capped tube equipped with a magnetic stir bar **3a** (39.1 mg, 0.1 mmol), t-BuOK (22.4 mg, 2.0 equiv), the mixture of solvents(t-BuOH: DMSO = 1:1, 2.0 mL) was added. The reaction mixture was stirred at room temperature. After the completion of reaction, the solvent was concentrated under reduced pressure, and the crude residue was

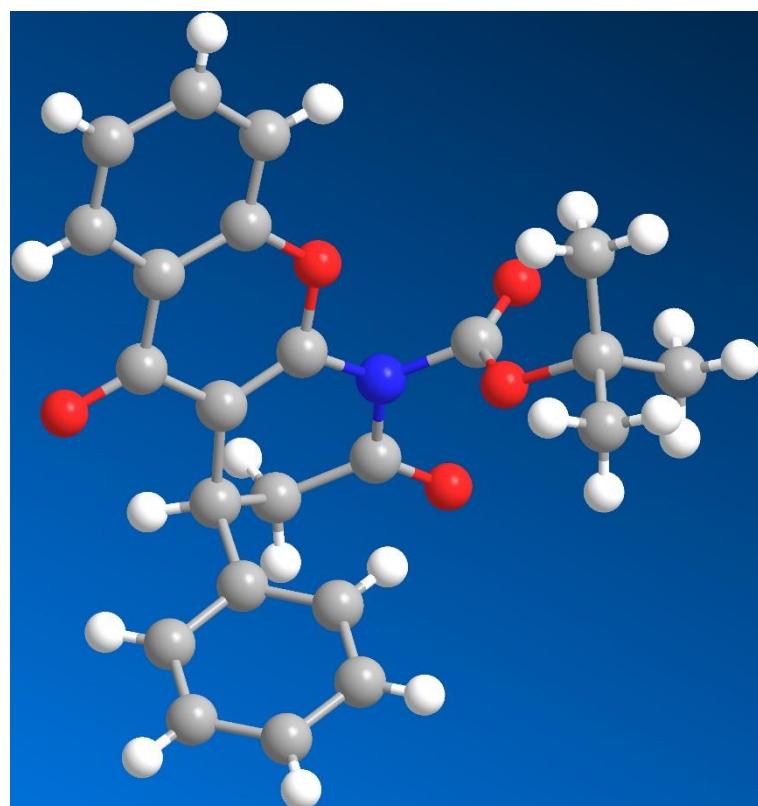

purified by flash chromatography (5% v/v methanol in DCM) to afford **4** as a white solid in 67% yield.

d) Stereochemistry determination **3a via X-ray crystallographic analysis**

Product **3a** was crystallized as a colorless crystal *via* vaporization of a hexane/ethyl acetate solution, and its relative configuration was determined by x-ray structure analysis. CCDC 2081889 contains the supplementary crystallographic data that can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
