Theoretical methods

The interaction energies of all complexes used were calculated at the B3LYP¹-D3²/def2-TZVP³ level of theory. The calculations have been performed by using the program TURBOMOLE version 7.0.⁴ The interaction energy values (ΔE) gathered in Tables 1 and 2 were calculated as the energy difference between the complex and the isolated monomers following the supermolecule approximation ($\Delta E_{\text{complex}} = E_{\text{complex}} - E_{\text{monomer1}} - E_{\text{monomer2}}$, see also Figures S1 and S2). In the case of complexes **5** to **14**, the optimization was carried out imposing the C2v symmetry point group to keep the salt bridge interactions in place. In case of calculations regarding PDB structures, the H atoms were initially optimized at the B3LYP-D3/def2-SVP³ level of theory. These geometries were taken as starting points for single point calculations using the def2-TZVP basis set. The MEP (Molecular Electrostatic Potential) surfaces were computed at the B3LYP/def2-TZVP level of theory by means of the Gaussian 16 calculation package. The Bader's "Atoms in molecules" theory has been used to study the interactions discussed herein by means of the AIMall calculation package.⁵ The calculations for the wavefunction analysis have been carried out at the B3LYP/def2-TZVP level of theory using Gaussian 16 software.⁶ The NCIplot⁷ isosurfaces correspond to both favorable and unfavorable interactions, as differentiated by the sign of the second density Hessian eigenvalue and defined by the isosurface color. The color scheme is a red–yellow–green–blue scale with red for repulsive (ρ^+_{cut}) and blue for attractive (ρ^-_{cut}) NCI interaction density. Yellow and green surfaces correspond to weak repulsive and weak attractive interactions,

respectively. Finally, solvent effects have been evaluated using the conductor-like screening model COSMO,⁸ which is a variant of the dielectric continuum solvation models.⁹ We have used water ($\epsilon = 78.4$) as solvent.

Obtention of the interaction energies

PDB structures

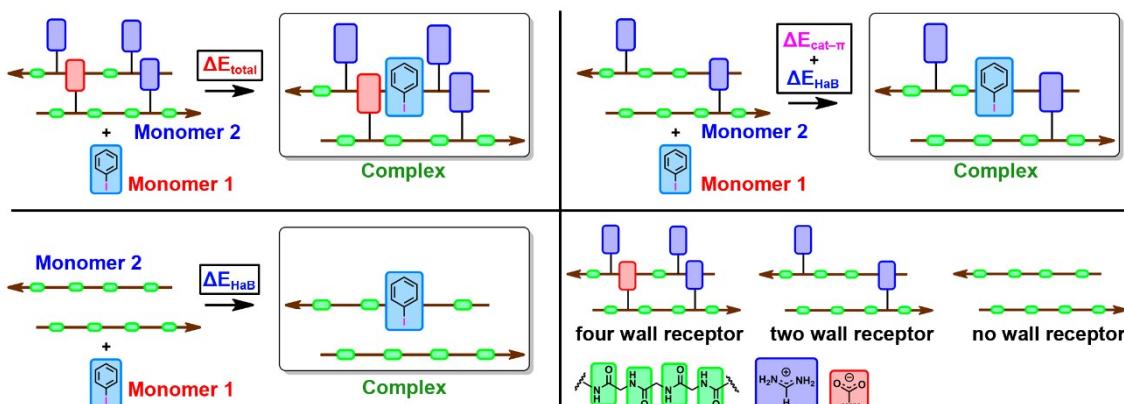

Figure S1. Schematic representation of the monomers and the complex used to compute the interaction energy values gathered in Table 1. $\Delta E_{\text{cation}-\pi}$ values were obtained as the difference between $(\Delta E_{\text{cat}-\pi} + \Delta E_{\text{Hab}}) - \Delta E_{\text{Hab}}$ values.

Complexes 5 to 14

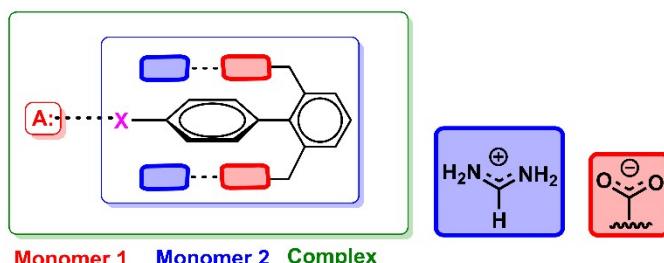

Figure S2. Schematic representation of the monomers and the complex used to compute the interaction energy values gathered in Table 2.

Additional MEP analysis

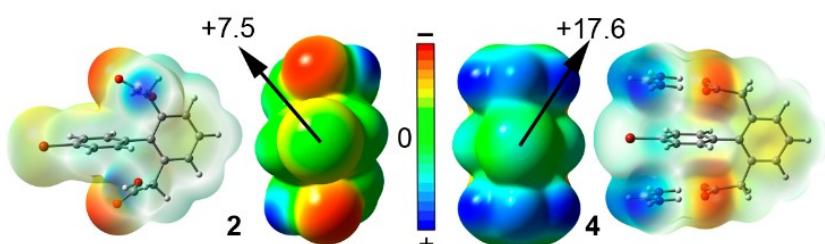

Figure S3. MEP (Molecular Electrostatic Potential) surface of compounds **2** and **4**. Energy values at concrete regions of the surface are given in kcal/mol (0.001 a.u.).
