## Assigned ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{2 \bullet 4} \mathbf{P F}_{6}$

Fig. S1 Partial ${ }^{1} \mathrm{H}$ NMR spectrum ( $400 \mathrm{MHz}, 298 \mathrm{~K}, \mathrm{CD}_{3} \mathrm{CN}$ ) of the [2]rotaxane 2•4PF 6 ( $\mathrm{c}=2 \mathrm{mM}$ ). The $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}, \mathrm{CD}_{2} \mathrm{HCN}$ and $\mathrm{H}_{2} \mathrm{O}$ signals are not shown in their full height.

## Synthesis of compound 9

10
11

Scheme S1 Synthesis of the MPTTF derivative 9.
Compounds $11^{\mathrm{S} 1}$ and $\mathbf{4}^{\mathrm{S2}}$ were synthesised according to literature procedures and compound 9 was synthesised as illustrated in Scheme S1. Initial deprotonation of the pyrrole N -H proton by NaH was followed by N -alkylation with the iodide 11 affording the MPTTF derivative 9 in $69 \%$ yield.

## Binding study between the model compound 9 and CBPQT ${ }^{4+}$

Scheme S2 Complexation between CBPQT ${ }^{4+}$ and the model compound 9 forming the [2]pseudorotaxane $9 \subset$ CBPQT $^{4+}$.
The binding constant $K_{a}$ between the model compound 9 and CBPQT ${ }^{4+}$ and the related free energy $\Delta G^{\circ}$ for the complexation process were determined using the UV/Vis/NIR dilution method described by Nygaard et al. ${ }^{\mathrm{S3}}$ Mixing equimolar amounts of the MPTTF derivative 9 (yellow) with a solution of CBPQT•4PF 6 (colourless) in MeCN immediately resulted in a green-coloured solution as a result of the formation of a charge-transfer complex with an absorption band centered at 815 nm in the UV-Vis-NIR spectrum. Two independent starting solutions ( 2.4 mL ) with an absolute concentration of $8.0 \times 10^{-4} \mathrm{M}$ were prepared and allowed to equilibrate at 298 K in the thermostated cell compartment of the spectrophotometer, before the absorbance $A_{\mathrm{m}}$ was measured. Subsequently, the solutions were repeatedly diluted to $5 / 6$ of its initial concentration with MeCN, resulting in two series of 13 data points $\left[A^{-1 / 2}, c A^{-1}\right]$ (Table S1).

Optical path length:
CBPQT•4PF6 in MeCN:
9 in MeCN:
Total background absorbance $A_{b}$ :
$I=1 \mathrm{~cm}$
$\varepsilon=3.9 \mathrm{M}^{-1} \mathrm{~cm}^{-1} \quad$ at $\lambda=815 \mathrm{~nm}$
$\varepsilon=2.5 \mathrm{M}^{-1} \mathrm{~cm}^{-1} \quad$ at $\lambda=815 \mathrm{~nm}$
$\varepsilon=6.4 \mathrm{M}^{-1} \mathrm{~cm}^{-1} \quad$ at $\lambda=815 \mathrm{~nm}$

Plotting $c A^{-1}$ as a function of $A^{-1 / 2}$ afforded a straight line with a slope $\alpha$ of $\left(1 / K_{a} \varepsilon\right)^{1 / 2}$ and a y-intercept $y_{0}$ of $1 / \varepsilon l$, where $\varepsilon$ is the molar extinction coefficient and $I$ is the optical path length. This linear plot gave a correlation coefficient of 0.998 . The values for $K_{a}$ and $\varepsilon$ were obtained from the relationship $K_{a}=y_{0} / \alpha^{2}$ and the already shown relationship for $y_{0}$, respectively. The free energies of complexation $\Delta G^{\circ}$ were obtained from the relationship $\Delta G^{\circ}=-R 7 n K_{\mathrm{a}}$, where $R$ is the gas constant and $T$ is the absolute temperature. The error of the binding constant ( $\Delta K_{\mathrm{a}}$ ) is determined using the method described by Nygaard et al. ${ }^{\Omega 3}$

Fig. S2 a) UV-Vis-NIR spectra recorded of a $1: 1$ mixture of 9 and CBPQT ${ }^{4+}$ at 298 K in MeCN. b) Plot of $1000 \mathrm{cA}^{-1}$ as a function of $A^{-1 / 2}$.

Table S1 The measured absorbance $A_{\mathrm{m}}$ for a $1: 1$ mixture of $\mathrm{CBPQT} \cdot 4 \mathrm{PF} 6$ and $9(\mathrm{MeCN}, 298 \mathrm{~K})$ at $\lambda_{\max }=815 \mathrm{~nm}$ at different concentrations $c$, and the actual absorbance $A$ obtained by subtracting the background absorbance $A_{\mathrm{b}}$ at 815 nm from the measured absorbance $A_{\mathrm{m}}$ (i.e. $A=A_{\mathrm{m}}-A_{\mathrm{b}}=A_{\mathrm{m}}-6.4 \mathrm{M}^{-1} \mathrm{~cm}^{-1} \times c \times I$ )

## Binding study between the semidumbbell 1 and CBPQT ${ }^{4+}$

Scheme S3 Complexation between CBPQT ${ }^{4+}$ and the semidumbbell 1 forming the [2]pseudorotaxane $1 \subset$ CBPQT $^{4+}$.
The binding constant $K_{a}$ between the semidumbbell 1 and CBPQT ${ }^{4+}$ and the related free energy $\Delta G^{\circ}$ for the complexation process were determined using the UV-Vis-NIR dilution method described by Nygaard et al. ${ }^{\text {S3 }}$ As the complexation process is slow exchange, the stock solutions were made one day in advance by mixing equimolar amounts of the semidumbbell 1 (yellow) with a solution of CBPQT•4PF6 (colorless) in MeCN. Overnight the stock solutions turned green as a result of the formation of a charge-transfer complex with an absorption band centered at 816 nm in the UV-Vis-NIR spectrum. Appropriate dilutions of the two independent stock solutions produced samples with absolute concentrations in the range of $6.7 \times 10^{-5}$ to $8.0 \times 10^{-4} \mathrm{M}$ which again was left overnight to equilibrate. The samples were allowed to equilibrate at 298 K in the thermostated cell compartment of the spectrophotometer, before the absorbance $A_{m}$ was measured which resulted in two series of 15 data points $\left[1 A^{-1 / 2}, c A^{-1}\right]$ (Table S2).

Optical path length:
CBPQT•4PF 6 in MeCN :
1 in MeCN:
Total background absorbance $A_{b}$ :

$$
\begin{array}{ll}
I=1 \mathrm{~cm} & \\
\varepsilon=4.1 \mathrm{M}^{-1} \mathrm{~cm}^{-1} & \text { at } \lambda=816 \mathrm{~nm} \\
\varepsilon=21 \mathrm{M}^{-1} \mathrm{~cm}^{-1} & \text { at } \lambda=816 \mathrm{~nm} \\
\varepsilon=25 \mathrm{M}^{-1} \mathrm{~cm}^{-1} & \text { at } \lambda=816 \mathrm{~nm}
\end{array}
$$

Plotting $c A^{-1}$ as a function of $A^{-1 / 2}$ afforded a straight line with a slope $\alpha$ of $\left(1 / K_{a} \varepsilon l\right)^{1 / 2}$ and a y-intercept $y_{0}$ of $1 / \varepsilon l$, where $\varepsilon$ is the molar extinction coefficient and $/$ is the optical path length. This linear plot gave a correlation coefficient of 0.980 . The values for $K_{a}$ and $\varepsilon$ were obtained from the relationship $K_{a}=y_{0} / \alpha^{2}$ and the already shown relationship for $y_{0}$, respectively. The free energies of complexation $\Delta G^{\circ}$ were obtained from the relationship $\Delta G^{\circ}=-R 7 n K_{\mathrm{a}}$, where $R$ is the gas constant and $T$ is the absolute temperature. The error of the binding constant $\left(\Delta K_{\mathrm{a}}\right)$ is determined using the method described by Nygaard et al. ${ }^{\mathrm{S3}}$

Fig. S3 a) UV-Vis-NIR spectra recorded of a $1: 1$ mixture of 1 and CBPQT ${ }^{4+}$ at 298 K in MeCN. b) Plot of $1000 \mathrm{cA}^{-1}$ as a function of $A^{-1 / 2}$.

Table S2 The measured absorbance $A_{m}$ for a 1:1 mixture of $\mathrm{CBPQT}^{2} 4 \mathrm{PF} 6$ and $\mathbf{1}(\mathrm{MeCN}, 298 \mathrm{~K})$ at $\lambda_{\max }=816 \mathrm{~nm}$ at different concentrations $c$, and the actual absorbance $A$ obtained by subtracting the background absorbance $A_{\mathrm{b}}$ at 816 nM from the measured absorbance $A_{m}$ (i.e. $A=A_{m}-A_{b}=A_{m}-25 \mathrm{M}^{-1} \mathrm{~cm}^{-1} \times c \times 1$ )

## Illustration of the redox processes taking place upon electrochemical oxidation of $\mathbf{2}^{4+}$ and $1 \subset C B P Q T^{4+}$

Scheme S4 Cartoon representation of the redox processes to produce $\mathbf{2 \cdot} \mathrm{OP}^{6+}$ upon electrochemical oxidation of 2•MPTTF ${ }^{4+}$.

Scheme S5 Cartoon representation of the redox processes to produce $1 \subset \mathrm{CBPQT} \cdot \mathrm{OP}^{6+}$ upon electrochemical oxidation of $\mathbf{1} \subset$ CBPQT•MPTTF ${ }^{4+}$.

## Kinetic investigations of $1 \subset C B P Q T \cdot M P T T F^{4+}$

Fig. S4 UV-Vis-NIR absorption spectra of the [2]pseudorotaxane $1 \subset C B P Q T \cdot M P T T F{ }^{4+}$ in MeCN at 298 K . The top spectrum is recorded as soon as possible after heating the solution to 298 K and the subsequent spectra are recorded every 10 s .

## Assigned ${ }^{1} \mathrm{H}$ NMR spectrum of $1 \subset C B P Q T^{4+}$

Fig. S5 Partial ${ }^{1} \mathrm{H}$ NMR spectrum ( $400 \mathrm{MHz}, 298 \mathrm{~K}, \mathrm{CD}_{3} \mathrm{CN}, 2 \mathrm{mM}$ ) recorded of an equilibrated $1: 2$ mixture of $\mathbf{1}$ and $\mathrm{CBPQT}{ }^{4+}$, where assignments in green are associated with the [2]pseudorotaxane $1 \subset \mathrm{CBPQT}^{4+}$ and assignments in blue are associated with the uncomplexed CBPQT ${ }^{4+}$. The region from 1.20 to 1.32 is scaled down.

## Oxidation experiments on $1 \subset$ CBPQT $^{4+}$ and $2^{4+}$

Fig. S6 Partial ${ }^{1} \mathrm{H}$ NMR spectra ( $400 \mathrm{MHz}, 298 \mathrm{~K}, \mathrm{CD}_{3} \mathrm{CN}, 2 \mathrm{mM}$ ) of $\mathbf{1}$ and CBPQT ${ }^{4+}$ (1:2 ratio), $\mathbf{1}$ and CBPQT ${ }^{4+}$ (1:2 ratio) + ten equiv. TBPASbCl 6 as soon as possible after mixing and 1 with ten equiv. $\mathrm{Fe}\left(\mathrm{ClO}_{4}\right)_{3}$. The areas omitted have no signals. The area from 1.2 to 1.4 ppm is scaled down to clarify the separation and height of the two $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}$ signals. The $\mathrm{CD}_{2} \mathrm{HCN}$ signal as well as the $\mathrm{H}_{2} \mathrm{O}$ signals are not shown in their full height. Blue assignments are from free $\mathrm{CBPQT}^{4+}$ and red assignments are from $1 \subset C B P Q T \cdot \mathrm{OP}^{6+}$. Only distinct signals are assigned.

Fig. S7 COSY spectrum ( 400 MHz , 298) recorded as fast as possible after addition of ten equiv. $\mathrm{TBPASbCl}_{6}$ to a solution of $1 \subset \mathrm{CBPQT}^{4+}$ in $\mathrm{CD}_{3} \mathrm{CN}(c=2 \mathrm{mM})$ resulting in $1 \subset \mathrm{CBPQT} \cdot \mathrm{OP}^{6+}$. The structure shown is the part of the stopper which is encircled by CBPQT ${ }^{4+}$.

Fig. S8 COSY spectrum ( $400 \mathrm{MHz}, 298 \mathrm{~K}$ ) as fast as possible after addition of ten equiv. TBPASbCl 6 to a solution in $\mathrm{CD}_{3} \mathrm{CN}$ of $\mathbf{2}^{4+}(c=2 \mathrm{mM})$ resulting in $\mathbf{2 \bullet} \mathrm{OP}^{6+}$. The structure shown is the part of the stopper encircled by CBPQT ${ }^{4+}$.

Fig. S9 Partial ${ }^{1} \mathrm{H}$ NMR spectra ( $400 \mathrm{MHz}, 298 \mathrm{~K}, \mathrm{CD}_{3} \mathrm{CN}$ ) of $\mathbf{2}^{4+}(2 \mathrm{mM})+$ tenequiv. TBPASbCl6 recorded 25,45 and 97 h after mixing and of $6+$ CBPQT $^{4+}(1: 1,2 \mathrm{mM})+$ ten equiv. TBPASbCl 6 . The $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}, \mathrm{CD}_{2} \mathrm{HCN},{ }^{+} \mathrm{NCH}_{2}$ and xylyl-H are not shown in full height. The blue assignments are from free CBPQT ${ }^{4+}$ and the black assignments are from $\mathbf{2}^{4+}$.

Fig. S10 Partial ${ }^{1} \mathrm{H}$ NMR spectra ( $400 \mathrm{MHz}, 298 \mathrm{~K}, \mathrm{CD}_{3} \mathrm{CN}$ ) of $\mathbf{2}^{4+}\left(c=2 \mathrm{mM}\right.$ with $0.2 \mathrm{M} \mathrm{NH}_{4} \mathrm{PF}_{6}$ ) + ten equiv. TBPASbCl 6 recorded 1, 6,23 and 48 h after mixing. The $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}, \mathrm{CD}_{2} \mathrm{HCN}, \mathrm{N}^{+} \mathrm{CH}_{2}, \mathrm{NH}_{4}{ }^{+}$and xylyl- H from free CBPQT ${ }^{4+}$ signals are not shown in their full height. The assigned resonances are all from $\mathbf{2}^{6+}$ or residual solvent peaks. The complete assignment can be found in Fig. S11.

It is evident that all four spectra in Fig. S10 are almost identical. By integrating the signals from the phenylene group in the bulky stopper unit and comparing the integrals to those of the tetramethylsilane(TMS) signal, it becomes clear that they are not changing over time. This observation indicates that $\mathbf{2}^{6+}$ is stable for more than 48 h in the presence of 100 equiv. $\mathrm{NH}_{4} \mathrm{PF}_{6}$ at 298 K and that $\mathrm{CBPQT}^{4+}$ does not deslip (Scheme S6).

Scheme S6 Movement mechanism in the [2]rotaxane $\mathbf{2 \cdot M P T T F}{ }^{4+}$ after addition of ten equiv. TBPASbCl .

## Determining the size of the $\mathrm{MPTTF}^{2+} / \mathrm{SMe} /$ TDEG barrier in $1 \subset \mathrm{CBPQT}^{6+}$

Fig. S11 Partial ${ }^{1} \mathrm{H}$ NMR spectra ( $400 \mathrm{MHz}, 298 \mathrm{~K}$ ) of $\mathbf{1}$ CCBPQT ${ }^{4+}$ produced by mixing $1(2 \mathrm{mM})$ and CBPQT ${ }^{4+}(4 \mathrm{mM})$ in $\mathrm{CD}_{3} \mathrm{CN}$ and then allowed to equilibrate for 10 h in the presence of $\mathrm{NH}_{4} \mathrm{PF}_{6}(0.2 \mathrm{M})$ followed by oxidation with ten equiv. TBPASbCl 6 . The spectra are recorded at different delay times after addition of $\mathrm{TBPASbCl}_{6}$. The areas omitted have no signals or only contain the residual solvent peak. The area from 1.2 to 1.4 ppm is scaled down to clarify the separation and height of the two $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{C}$ signals. The $\mathrm{NH}_{4}$ signal as well as the $\mathrm{H}_{2} \mathrm{O}$ signal are not shown in their full height. Assignments in blue are from free CBPQT ${ }^{4+}$, assignments in red are from $1 \subset \mathrm{CBPQT} \cdot \mathrm{OP}^{6+}$ and assignments in black are from $\mathbf{1}^{2+}$.

The stability of $1 \subset \mathrm{CBPQT}^{6+}$ over time is poor. To keep it stable all experiments are performed with the presence of $0.2 \mathrm{M} \mathrm{NH}_{4} \mathrm{PF}_{6}$, which is found to increase the stability of oxidised MPTTF.
Because it is possible to follow the movement of CBPQT4+ from the position around the OP station in $1 \subset \mathrm{CBPQT} \cdot \mathrm{OP}^{6+}$ and over the MPTTF ${ }^{2+} / \mathrm{SMe} / T D E G$ barrier, it is possible to qualitatively determine the size of the combined MPTTF²+/SMe/TDEG barrier. The experiments shown in Fig. S11 were repeated, but spectra were recorded more frequently (every hour for three days) to get enough data points to calculate the rate of CBPQT ${ }^{4+}$ deslipping from $1 \subset$ CBPQT $^{6+}$. The experiments were repeated at 294, 303, 308, 313 and 323 K , and the first ${ }^{1} \mathrm{H}$ NMR spectrum was recorded as soon as possible after addition of ten equiv. TBPASbCl 6 to an equilibrated 1:2 mixture of the semidumbbell 1 and $\mathrm{CBPQT}^{4+}$ in $\mathrm{CD}_{3} \mathrm{CN}$ with $\mathrm{NH}_{4} \mathrm{PF}_{6}$ ( 0.2 M ). By treating the deslipping as a first order process, it is possible to use first order kinetics ( $\ln /$ as a function of time, $t$, Fig. S12) to determine the rate constant $k_{d}$ for the movement of CBPQT ${ }^{4+}$.

Fig. S12 The natural logarithm of the integral of the singlets ( 294 K ) resonating at 1.29 and 1.37 ppm , respectively, as a function of time. The red data points are used to make a linear regression, from which the slope and thereby the rate constant of CBPQT ${ }^{4+}$ deslipping over the MPTTF ${ }^{2+} /$ SMe/TDEG barrier can be found.

Table S3 Rate constants, $k_{d}$, energies of activation, $\Delta G^{\ddagger} d$ and correlation coefficients, $R^{2}$, from CBPQT ${ }^{4+}$ deslipping over the $\mathrm{MPTTF}^{2+} / \mathrm{SMe} / \mathrm{TDEG}$ barrier measured at 294 K in $\mathrm{CD}_{3} \mathrm{CN}\left(0.2 \mathrm{M} \mathrm{NH}_{4} \mathrm{PF}_{6}\right)$ by following the process with ${ }^{1} \mathrm{H}$ NMR spectroscopy ( 500 MHz ), using different signals as probes. Errors are calculated based on Koumura et al. ${ }^{\mathrm{S4}}$ with $\Delta T=0.2 \mathrm{~K}$ and $\Delta I=0.05 \%$

| 313 | 22 | $4.69 \times 10^{-6} \pm 3.36 \times 10^{-9}$ | $26.14 \pm 0.02$ |
| 323 | 8 | $1.02 \times 10^{-5} \pm 1.05 \times 10^{-8}$ | $26.37 \pm 0.02$ |

By plotting the derived activation energies $\left(\Delta G^{\ddagger}{ }_{\mathrm{d}}\right)$ as a function of temperature ( $T$ ), it is possible to determine the enthalpy $\left(\Delta H^{\not} d\right)$ and the entropy $\left(\Delta S^{\ddagger} d\right)$ according to the equation $\Delta G^{\ddagger}{ }_{d}=\Delta H^{\not{ }_{d}}-T \times \Delta S^{\not}{ }_{\mathrm{d}}$. The plot is shown in Fig. S13 and the kinetic parameters are summarized in Table S9.

Fig. S13 The average activation energy ( $\Delta G^{\ddagger} \mathrm{d}$ ) plotted against the temperature ( $T$ ) in order to find the enthalpy ( $\Delta H^{\ddagger}{ }_{\mathrm{d}}$ ) and the entropy $\left(\Delta S^{\ddagger} d\right)$. The slope and intercept of the linear regression give the values $-\Delta S^{\ddagger} d$ and $\Delta H^{\ddagger}$, respectively from the equation $\Delta G^{\ddagger}{ }_{d}=\Delta H^{\ddagger} d-T \times \Delta S^{\ddagger} \mathrm{d}$.

Table S9 Kinetic parameters for the movement of CBPQT ${ }^{4+}$ from the OP station over the MPTTF ${ }^{2+} /$ SMe/TDEG barrier in $\mathbf{2}^{2+}$ obtained by ${ }^{1} \mathrm{H}$ NMR spectroscopy ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}, 0.2 \mathrm{M} \mathrm{NH}_{4} \mathrm{PF}_{6}$ ) at 298 K
