**General Information:** Unless otherwise specified, all reagents were purchased from commercial sources and used without further purification. Solvents were dried and degassed using a solvent purification system. $^1$H and $^{13}$C NMR spectra were recorded in CDCl$_3$ ($^1$H: 7.26 ppm; $^{13}$C: 77.16 ppm) or DMSO-$d_6$ ($^1$H: 2.50 ppm; $^{13}$C: 39.52 ppm) or CD$_2$OD ($^1$H: 3.31 ppm; $^{13}$C: 49.00 ppm) or CD$_2$Cl$_2$ ($^1$H: 5.32 ppm) using Bruker 400 and 100 MHz spectrometers, respectively. Coupling constants ($J$) are expressed in hertz (Hz). Infrared (FT-IR) spectra were recorded on a PerkinElmer frontier FT-IR spectrometer. Size exclusion chromatography (SEC) was performed on a Malvern GPCmax system. THF was used as the eluent at a flow rate of 0.8 mL min$^{-1}$. UV-vis spectroscopy data were recorded on an Agilent Cary 100 UV-vis spectrometer in 10 mm quartz cuvettes. Thermogravimetric analysis (TGA) data were recorded under nitrogen at a flow rate of 60 mL min$^{-1}$ on a TA Instruments TGA Q500 module at a heating rate of 10 ℃ min$^{-1}$ and using a platinum sample pan. Differential scanning calorimetry (DSC) data were recorded under nitrogen at a flow rate of 50 mL min$^{-1}$ on a TA Instruments DSC Q2000 module at a heating and cooling rate of 10 or 20 ℃ min$^{-1}$ and using a Tzero aluminium sample pan and lid. High-resolution mass spectra (HRMS) were recorded in electrospray ionization (ESI) or atmospheric pressure chemical ionization (APCI) mode on a Waters Xevo G2-XS QTof mass spectrometer. Polarized optical microscopy (POM) images were recorded using an Olympus BX53-P system that was equipped with a rotatable graduated sample platform, an Instec HCS402 dual heater temperature stage and a QImaging Retiga 2000R CCD camera. X-ray diffraction (XRD) data were recorded on a Rigaku D/MAX2500V/PC equipped with a Cu-rotating anode X-ray system. Melting points were performed on a MPA 100 Optimelt Automated Melting point system and are uncorrected.

**General Procedure A:** An oven-dried 150 mL pressure tube was charged with 1,4-phenylenediacetic acid (15 mmol) and an alcohol (30 mL). H$_2$SO$_4$ (2 mL) was added dropwise to the solution. The reaction mixture was stirred at 80 ℃ for 20 h, and then cooled to room temperature. The residual alcohol was removed under reduced pressure. An aqueous solution saturated with NaHCO$_3$ (50 mL) was added to the solution until a pH of 7 was measured and then extracted with CH$_2$Cl$_2$ ($3 \times 30$ mL). The organic layers were combined, dried over anhydrous MgSO$_4$ and concentrated under reduced pressure to afford the corresponding ester.

**General Procedure B:** An oven-dried, 100 mL Schlenk flask was charged with dialkyl 2,2'-(1,4-phenylene)diacetate (10.00 mmol) and 25 mL of CHCl$_3$. After the addition of NBS (24.00 mmol) and AIBN (0.20 mmol), the resulting mixture was stirred at 60 ℃ for 24 h. After cooling
solution to room temperature, a solid precipitate formed and was removed by filtration. The filtrate was washed with an aqueous solution saturated with NaHCO$_3$ (30 mL). The aqueous layer was extracted with CH$_2$Cl$_2$ (3 × 20 mL). The organic layers were combined, dried over anhydrous MgSO$_4$ and concentrated under reduced pressure. The crude product was further purified by column chromatography.

**General Procedure C:** An oven-dried, 200 mL 2-neck flask was charged with an alcohol (6.30 mmol) and 60 mL of CH$_2$Cl$_2$. After adding dicyclohexyl carbodiimide (DCC) (6.60 mmol), DMAP (0.30 mmol), and 7 (see below) (3.00 mmol) at 0 °C, the resulting mixture was stirred at room temperature for 20 h. Solids that precipitated were removed by filtration and the filtrate was washed with an aqueous solution saturated with NaHCO$_3$ (60 mL), water (60 mL) and brine (60 mL). The organic layer was dried over anhydrous MgSO$_4$ and concentrated under reduced pressure. The crude product was further purified by column chromatography.

Figure S100. DSC data recorded for PPX-2i before (black) and after irradiation at 365 nm for 4 h to facilitate the photoisomerization of trans to cis (red, 92% cis by \(^1\)H NMR). The cis isomer was kept in the dark and checked via DSC after 1 d (blue, 47% cis by \(^1\)H NMR) and 2 d (green, 30% cis by \(^1\)H NMR). The broad exothermic signals recorded at 70 °C were assigned to the thermal isomerization of cis to trans. All measurements are performed at a heating rate of 20 °C min\(^{-1}\) and under an atmosphere of N\(_2\).

Figure S103. XRD data recorded for the cholesterol derivatives of 2g at 50 °C, PPX-2g at 100 °C, BrPPX-2g at 120 °C and PPV-2g at 120 °C.

Figure S104. XRD data recorded for the cholesterol derivatives of 2h at 25 °C, PPX-2h at 100 °C, BrPPX-2h at 100 °C and PPV-2h at 100 °C.
Figure S105. UV-vis spectra recorded for a solution of PPX-2i in CH₂Cl₂ (concentration: 4.2 × 10⁻⁵ M) to ascertain the photostationary state of cis formation over time. Note: 96% cis was measured after 150 s of irradiation (red) using the following equation: \([\text{cis}]/[\text{trans}]_0 = (1 – \frac{A}{A_0})(1 – \frac{\varepsilon_{\text{cis}}}{\varepsilon_{\text{trans}}})\), where \([\text{cis}]\) = concentration of the cis fraction, \([\text{trans}]_0\) = initial concentration of the trans fraction, \(A\) = absorbance at \(\lambda_{\text{max}}\) (348 nm) and \(\frac{\varepsilon_{\text{cis}}}{\varepsilon_{\text{trans}}} = 0.050\) (from the literature⁸). UV source: Hg lamp, 300 W, 8 cm distance.
Figure S106. UV-vis spectra recorded for a solution of PPX-2i in CH₂Cl₂ (concentration: 1.1 × 10⁻⁵ M) and used to assess photofatigue. UV source: Hg lamp, 300 W, 8 cm distance. Visible light source: green LED (520 nm).
