## Experimental section

### Materials

All reagents from commercial sources were used without further purification, unless otherwise noted. Anhydrous solvents were purchased from Kanto Chemical. 4-Ethynyltoluene was purchased from Tokyo Chemical Industry. Neodecanoic acid (NDA) was purchased from Wako Pure Chemical Industries. 1-(2-Pyrimidinyl)pyrrole (**1a**) was prepared referring to a procedure in the literature.<sup>1</sup> 2,7-Bis(4-ethynylphenyl)-9,9-bis(2-ethylhexyl)fluorene (**2a**) was prepared referring to procedures in the literature<sup>2-4</sup> and the <sup>1</sup>H NMR spectrum essentially agrees with that in the previous report.<sup>2</sup> 1-(2-Pyridyl)pyrrole (**1b**), 2,7-diethynyl-9,9-bis(2-ethylhexyl)fluorene (**2b**), and [Cp\*Co(CH<sub>3</sub>CN)<sub>3</sub>](SbF<sub>6</sub>)<sub>2</sub> were prepared by the same method as our previous report.<sup>2</sup> 1-(*N,N*-dimethylcarbamoyl)pyrrole (**1c**) was prepared referring to a procedure in the literature.<sup>5</sup> The other reagents were also purchased from Kanto Chemical, Tokyo Chemical Industry, and Sigma Aldrich.

### General methods

<sup>1</sup>H NMR spectra were recorded on Bruker AVANCE-400 or AVANCE-600 NMR spectrometers. <sup>1</sup>H NMR spectra were measured with TMS (0.00 ppm for <sup>1</sup>H NMR) and C<sub>2</sub>HD<sub>3</sub>Cl<sub>2</sub> (3.72 ppm for <sup>1</sup>H NMR) as an internal reference. Gel permeation chromatography (GPC) measurements were carried out on a SHIMADZU prominence GPC system equipped with polystyrene gel columns, using THF as an eluent after calibration with polystyrene standards. MALDI-TOF-MS were recorded on an AB SCIEX MALDI TOF/TOF 5800 using *trans*-2-[3-(4-*tert*-butylphenyl)-2-methyl-2-propenylidene]malononitrile (DCTB) as matrix. GC-MS were recorded on a SHIMADZU GC-2010 Plus and a GCMS-QP2010 Ultra.

### Procedure for time course model reaction

To a stirred solution of a pyrrole substrate (0.10 mmol), 4-ethynyltoluene (12.7 μL, 0.10 mmol), and 1,3,5-trimethoxybenzene (11.2 mg, 0.067 mmol) in anhydrous 1,2-dichloroethane-*d*<sub>4</sub> (1.5 mL) was added [Cp\*Co(CH<sub>3</sub>CN)<sub>3</sub>](SbF<sub>6</sub>)<sub>2</sub> (1.58 mg, 0.0020 mmol) at 0 °C. A portion of 500 μL was transferred from the mixture to the NMR tube under a nitrogen atmosphere. After adding neodecanoic acid (1.89 μL, 0.010 mmol) to the reaction mixture, <sup>1</sup>H NMR data were measured at 0, 5, 10, 20, 30, 40, 50, 60, 90, 130, and 180 min at 10 °C.

### General procedure for equimolar model reactions

To a stirred solution of a pyrrole substrate (0.10 mmol), 4-ethynyltoluene (12.7 μL, 0.10 mmol), and 1,3,5-trimethoxybenzene (11.2 mg, 0.067 mmol) in anhydrous 1,2-dichloroethane (DCE, 1.5 mL) was added [Cp\*Co(CH<sub>3</sub>CN)<sub>3</sub>](SbF<sub>6</sub>)<sub>2</sub> (1.58 mg, 0.0020 mmol) and neodecanoic acid (NDA, 5.68 μL, 0.030 mmol) at 0 °C. The reaction mixture was stirred for 3 h at 10 °C under nitrogen atmosphere. A portion of the reaction mixture was sampled at 0, 1, 2, and 3 h. The NMR yield at each reaction time was obtained from the integral value of the signal for the product on the basis of the internal standard (1,3,5-trimethoxybenzene).

### General procedure for nonstoichiometric hydroarylation polyaddition

To a stirred solution of a pyrrole monomer and an alkyne monomer with the prescribed feed ratio at 0.10 mmol scale in anhydrous DCE (1.5 mL) was added  $[\text{Cp}^*\text{Co}(\text{CH}_3\text{CN})_3](\text{SbF}_6)_2$  (1.58 mg, 0.0020 mmol) and NDA (5.68  $\mu\text{L}$ , 0.030 mmol) at 0 °C. The reaction mixture was stirred for a prescribed time at 10 °C under nitrogen atmosphere in the dark. Then the reaction mixture was diluted with DCE (50 mL) and poured into  $\text{NH}_3$  solution (28% in water, 50 mL). The organic layer was washed with  $\text{NH}_3$  solution and distilled water (100 mL x 2). The organic layer was dried over sodium sulfate and filtered through a Celite® plug. The solution of DCE was concentrated and reprecipitated into methanol. The precipitate was washed with hexane and a polymeric product was obtained.

### Hydroarylation of Paa with 1-(*N,N*-dimethylcarbamoyl)pyrrole (**1c**)

The reaction mixture was stirred for 24 h at 30 °C under nitrogen atmosphere in the dark. The reaction mixture was diluted with DCE (10 mL) and poured into  $\text{NH}_3$  solution (28% in water, 10 mL). The organic layer was washed with  $\text{NH}_3$  solution and distilled water (10 mL x 3). The organic layer was dried over sodium sulfate and filtered through a Celite® plug. The solution of DCE was concentrated and reprecipitated into methanol. The precipitate was collected as a yellow solid in 63% yield (13.3 mg,  $M_{n(\text{NMR})} = 5,200$ ,  $M_{n(\text{GPC})} = 7,400$ , PDI = 2.6).
