Section S1. Instruments and Computational Details

Single crystal structure determination

Single crystal X-ray diffraction data of $\text{Cs}_2\text{MoO}_3(\text{CO}_3)$ and $\text{Cs}_3\text{MoO}_4(\text{HCO}_3)$ were collected on a Bruker D8 Venture diffractometer with graphite monochromatic Mo K α radiation at 150(2) K. The structures were solved by the direct methods and refined with SHELX-2014.¹ The position of the heavy atoms is determined by the heavy atom method, and all the hydrogen atoms were located geometrically or in a difference Fourier map. Both of the structures were verified with PLATON.² Relevant crystallographic data for $\text{Cs}_2\text{MoO}_3(\text{CO}_3)$ and $\text{Cs}_3\text{MoO}_4(\text{HCO}_3)$ are summarized in Table 1. Further information including atomic coordinates and isotropic displacement coefficients, selected bond lengths are listed in Tables S1-S4 in the supporting information.

Powder X-ray Diffraction

X-ray diffraction were used to confirm the purity of the compounds, and polycrystalline materials were measured at room temperature on a Smart lab powder X-ray diffractometer using Cu K α radiation ($\lambda=1.540598 \text{ \AA}$). The crystal samples were ground into powder suitable for diffraction experiments, and then the sample powder was put into a test piece with a very flat surface. The angular range of 2θ is from 5 to 70°, and the scan step width is 0.08° and step time is 0.2 s.

Infrared Spectroscopy

IR spectra were collected using a Vertex 70 Fourier transform infrared (FT-IR) spectrometer in the range of 4000-400 cm⁻¹. 1 mg powder samples of title compounds and dry KBr about 100 mg were mixed evenly in an agate mortar. After thorough grinding, the mixture was placed evenly between the solid tablet mold, then pressed and hold for 1-2 minutes under a pressure of about 10 T/ cm², and a uniform translucent tablet with a diameter of 13 mm and a thickness of about 1 mm was obtained.

Thermal Analysis

Thermogravimetric analysis (TGA) was performed on a Netzsch STA 409 PC. A 10 mg crystal samples were sealed in a platinum crucible and heated from room temperature to 800 ° C at a rate

of 10 °C/min in a N₂ atmosphere.

UV-vis Diffuse Reflectance Spectroscopy

UV-vis diffuse reflectance spectra of Cs₂MoO₃(CO₃) and Cs₃MoO₄(HCO₃) were recorded at room temperature with a PerkinElmer Lamda-950 UV/VIS/NIR spectrophotometer and scanned in the range of 190-800 nm.

Theoretical Calculations

In order to better understand the electronic structures of Cs₂MoO₃(CO₃) and Cs₃MoO₄(HCO₃), the theoretical calculations were processed using density functional theory (DFT) in the CASTEP program suite.³ All calculations were performed using the Perdew-Burke-Ernzerhof (PBE) under generalized gradient approximation (GGA).⁴ The energy cutoffs of the plane wave basis and the *k*-point sampling Brillouin zones for Cs₂MoO₃(CO₃) and Cs₃MoO₄(HCO₃) were set to be 750 eV / 830 eV, 1 × 1 × 1 / 2 × 4 × 2, respectively.

Table S1. Atomic coordinates ($\times 10^4$) and equivalent isotropic displacement parameters ($\text{\AA}^2 \times 10^3$), and calculated Bond Valence Sum for $\text{Cs}_2\text{MoO}_3(\text{CO}_3)$. U_{eq} is defined as one third of the trace of the orthogonalized U_{ij} tensor.
