#### S1. General information

NMR measurements were conducted on a Bruker AM 400 spectrometer. High resolution electrospray mass spectra (HRMS) was measured on G6500 from Agilent for complexes. Absorption spectra were measured on a UV-3100 spectrophotometer and photoluminescence spectra were obtained from a Hitachi F-4600 photoluminescence spectrophotometer. Cyclic voltammetry measurements were conducted on a MPI-A multifunctional electrochemical and chemiluminescent system (Xi'an Remex Analytical Instrument Ltd. Co., China) at room temperature, with a polished Pt plate as the working electrode, platinum thread as the counter electrode and Ag-AgNO<sub>3</sub> (0.1 M) in CH<sub>3</sub>CN as the reference electrode, tetra-*n*-butylammonium perchlorate (0.1 M) was used as the supporting electrolyte, using Fe<sup>+</sup>/Fe as the external standard, the scan rate was 0.1 V/s. HOMO energy was calculated from the oxidation potential with the formula of HOMO = -[E<sub>ox</sub> - E<sub>(Fc/Fc<sup>+</sup>)</sub> + 4.8] eV. The energy gap (*E*<sub>g</sub>) of HOMO and LUMO was calculated from the onset of the absorption spectrum with the formula of *E*<sub>g</sub> = 1240 / λ<sub>onset</sub> and LUMO energy was calculated from HOMO - *E*<sub>g</sub>. The absolute photoluminescence quantum yields ( $\Phi$ ) and the decay lifetimes of the compounds was measured with HORIBA FL-3 fluorescence spectrometer. Thermogravimetric analysis (TGA) was performed on a Pyris 1 DSC under nitrogen at a heating rate of 10 °C min<sup>-1</sup>. The single crystals of complexes were carried out on a Bruker SMART CCD diffractometer using monochromated Mo Ka radiation ( $\lambda$  = 0.71073 Å) at room temperature. Cell parameters were retrieved using SMART software and refined using SAINT on all observed reflections. HPLC Analysis

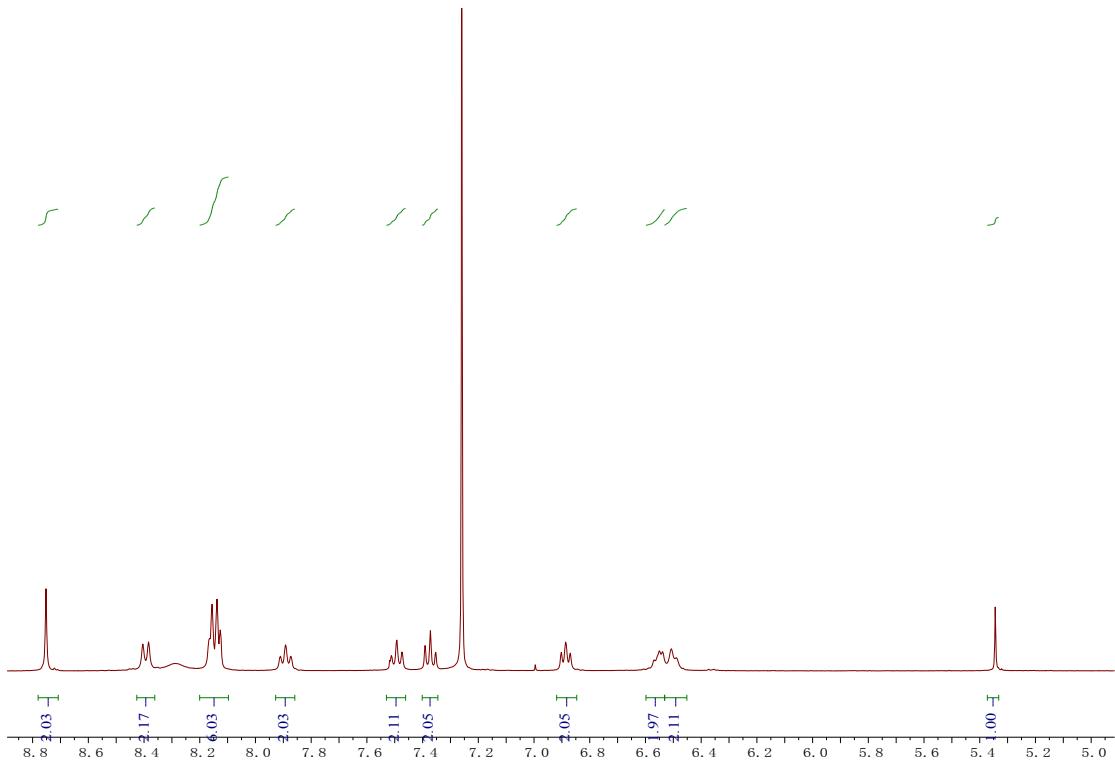

Conditions: a) Column: Cat. No. EnantioPak®Y7, 5 $\mu$ m, 250 × 30 mm; b) Mobile phase: n-Hexane/Ethanol = 60/40(v/v); c) Flow rate: 24.0 mL/min; d) Abs. detector: 254 nm.

## S2. OLEDs fabrication and measurement.

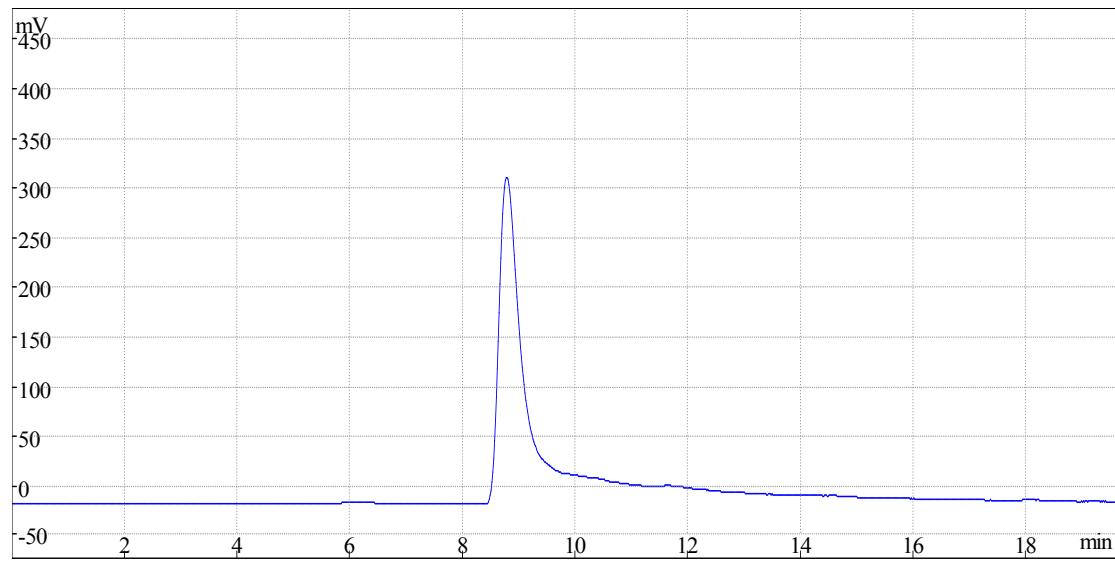

All OLEDs were fabricated on the pre-patterned ITO-coated glass substrate with a sheet resistance of 15  $\Omega$   $\text{sq}^{-1}$ . The deposition rate for organic compounds is 1-2  $\text{\AA s}^{-1}$ . The phosphor and the host (2,6DCzPPy) was co-evaporated to form emitting layer from two separate sources. The cathode consisting of LiF / Al was deposited by evaporation of LiF with a deposition rate of 0.1  $\text{\AA s}^{-1}$  and then by evaporation of Al metal with a rate of 3  $\text{\AA s}^{-1}$ . The characteristic curves of the devices were measured with a computer which controlled KEITHLEY 2400 source meter with a calibrated silicon diode in air without device encapsulation. On the basis of the uncorrected PL and EL spectra, the Commission Internationale de l'Eclairage (CIE) coordinates were calculated using a test program of the Spectra scan PR650 spectrophotometer, The EQE of EL devices were calculated based on the photo energy measured by the photodiode.
