## **1. General considerations**

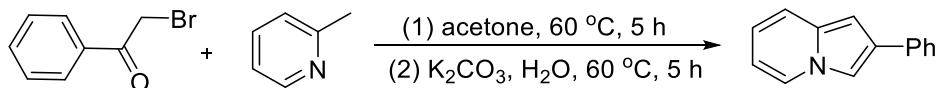

<sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded using a Bruker DRX-400 spectrometer using CDCl<sub>3</sub> as solvent. Chemical shifts were recorded in parts per million (ppm,  $\delta$ ) relative to tetramethylsilane ( $\delta$  0.00) or chloroform ( $\delta$  = 7.26, singlet). The data of HRMS was carried out on a high-resolution mass spectrometer (LCMS-IT-TOF). IR spectra were obtained either as potassium bromide pellets or as liquid films between two potassium bromide pellets with a Bruker TENSOR 27 spectrometer. Melting points were determined with a Büchi Melting Point B-545 instrument. The instrument for electrolysis is dual display potentiostat (CHI 660E) (made in China). Unless otherwise noted, materials were obtained from commercial suppliers and used without further purification.

## 2. Experimental procedures and characterization data

### 2.1 Experimental procedures

#### Synthesis of substrate 1 according to the following procedure:

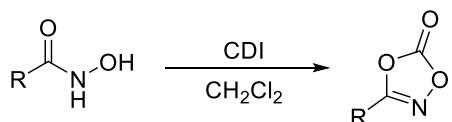

The substrates **1a-1ag** are known and were prepared according to the procedures in the literature.<sup>1-3</sup> As exemplified for **1a**:

A solution of 2-picoline (0.93 g, 10 mmol, 1.0 equiv.) and 2 bromoacetophenone (1.99 g, 10 mmol, 1.0 equiv.) in acetone (50 mL) were added to a 100 mL round bottom flask and heated with a heating mantle at 60 °C for 5 hours. The precipitate obtained by filtration separation was redissolved in 20 mL of hot water (60 °C). Then, K<sub>2</sub>CO<sub>3</sub> (1.38 g, 10 mmol, 1.0 equiv.) was added and heated at 60 °C for 5 hours. After filtration and drying in vacuo, a white solid compound was obtained in 50% overall yield (0.965 g, 5 mmol) without further purification.

#### Synthesis of 3-substituted-1,4,2-dioxazol-5-ones according to the following procedure:

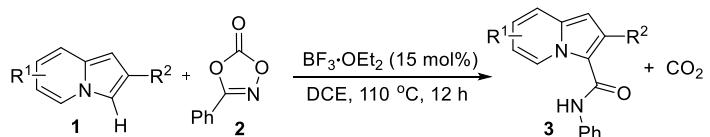

The substrates **2a-2m** are known and were prepared according to the procedures in the literature.<sup>4-6</sup>

To a stirred solution of hydroxamic acid (5.0 mmol) in dichloromethane (50 mL) was added 1,1'-carbonyldiimidazole (0.81 g, 5.0 mmol) in one portion at room temperature. After stirring for 30 min, the reaction mixture was quenched with 1 N HCl (30 mL), extracted with dichloromethane three times (50 mL x 3) and dried over sodium sulfate. The solvent was removed under reduced pressure to afford 3-substituted 1,4,2-dioxazol-5-ones. Product was recrystallized with acetone/hexane, if necessary.

#### Synthesis of product 3 according to the following procedure:

As exemplified for **3a**:

A pressure tube was charged with 2-phenylindazine **1a** (0.058 g, 0.3 mmol), dioxazolone **2a** (0.734 g, 0.45 mmol) and DCE (2 mL).  $\text{BF}_3\cdot\text{OEt}_2$  (0.006 g, 0.045 mmol) was added and the mixtures were heated with a heating mantle at 110 °C for 12 h. After cooling to room temperature, the solvent was volatilized and the crude product was purified by flash column chromatography on silica gel (eluent: PE/DCM = 1/1, v/v), and the target compound **3a** was obtained.

#### **Scale-up experiment:**

An oven-dried 50 mL Schlenk flask was charged with a stirring bar, 2-phenylindazine **1a** (1.158 g, 6.0 mmol), dioxazolone **2a** (1.467 g, 9.0 mmol) and DCE (15 mL).  $\text{BF}_3\cdot\text{OEt}_2$  (0.127 g, 0.9 mmol) was added and the mixture was heated with a heating mantle at 110 °C for 12 h. After cooling to room temperature, the solution was then diluted with EtOAc and water, extracted with EtOAc. The combined organic extracts were dried over anhydrous  $\text{Na}_2\text{SO}_4$ , filtered, and concentrated. The crude product was purified by flash column chromatography on silica gel (eluent: PE/DCM = 1/1, v/v), and the target compound **3a** (1.634 g, 87% yield) was obtained.

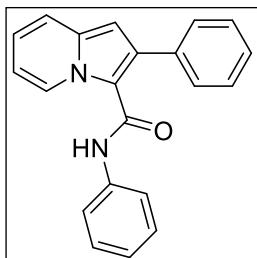

#### **Fluorescence experimental procedure:**

Weigh compound **4k** of 0.05 g, add 1 mL DCM into EP tube to dissolve, then transfer to 100 ml volumetric bottle, continue to dilute with DCM to scale, shake well, and set aside. Take 1mL of the above solution, transfer it to a 100 mL volumetric bottle and dilute it to the scale, then mix it into  $10^{-6} \text{ mol}\cdot\text{L}^{-1}$  standard reserve solution for fluorescence test. Turn on the power, turn on the fluorophotometer and the computer, preheat the instrument, initialize the instrument, and measure the fluorescence intensity according to the excitation and emission fluorescence spectrometry. Determine the fluorescence intensity of compound **4k** in different solvents, replace DCM with other solvents and repeat the above experimental steps.

## 4. X-ray crystallographic data

**Figure 1** X-ray single crystal structure of **3e**

Single crystals of **3e** were grown by slow evaporation of its DCM/PE solution. Single-crystal X-ray diffraction data were collected with a 'multiwire proportional' diffractometer. The crystal was kept at 100 K during data collection. Using Olex2, the structure was solved with the olex2.solve structure solution program using Charge Flipping and refined with the olex2.refine refinement package using Least Squares minimization. Supplementary crystallographic data have been deposited at the Cambridge Crystallographic Data Center (CCDC 2046530).
