General Information

All photoredox-catalyzed reactions in Table 1-4 were carried out in oven-dried Schlenk tubes under nitrogen atmosphere using anhydrous solvent purchased from Energy Chemical. All enamides or enecarbamates were prepared using existing
methods.\textsuperscript{1-2} Perfluoroalkyl iodides and ethyl bromodifluoroacetate were purchased from Energy Chemical. \textsuperscript{1}H, \textsuperscript{19}F, \textsuperscript{13}C NMR spectra were recorded in CDCl\textsubscript{3} or (CD\textsubscript{3})\textsubscript{2}SO on Bruker Avance 400 MHz spectrometers. Data are reported in the following order: chemical shift (\(\delta\)) in ppm; multiplicities are indicated s (singlet), d (doublet), t (triplet), dd (doublet of doublets), m (multiplet); coupling constants (\(J\)) are in Hertz (Hz). NMR spectra were taken using TMS (\(\textsuperscript{1}H, \delta = 0\)), CDCl\textsubscript{3} (\(\textsuperscript{1}H, \delta = 7.26\)), and CDCl\textsubscript{3} (\(\textsuperscript{13}C, \text{CPD} \delta = 77.16\)) as the internal standards, respectively. HRMS were obtained on an IonSpec FT-ICR mass spectrometer with ESI resource. Column chromatography was generally performed on silica gel (300-400 mesh) and reactions were monitored by thin layer chromatography (TLC) using UV light to visualize the course of the reactions.

The photoredox-catalyzed transformations were carried out in a customized dark cassette equipped with three 60 W (or 15 W) blue LEDs lamp from different directions for irradiation along with an electronic cooling fan for heat dissipation (Figure S1). A Heidolph magnetic hotplate stirrer was placed in the dark cassette for stirring. The reaction vessel was placed in the center of the stirrer so that the average distance from the lamp to the reaction medium was 10 cm.

General Procedures for the Synthesis of β-perfluoroalkylated Enamides

To a Schlenk tube equipped with a magnetic stir bar was charged with enamides 1 (0.3 mmol), perfluoroalkyl iodide 2 (0.9 mmol), Eosin Y (9.7 mg, 5 mol%), and DABCO (134.6 mg, 1.2 mmol). The tube was sealed with a septum, evacuated and backfilled with nitrogen three times. 1.0 mL acetonitrile was added via syringe with gentle stirring. The tube was sealed and stirred under 60 W blue LEDs for 12 h. The resulting mixture was extracted with ethyl acetate. The combined organic phase was dried over anhydrous sodium sulfate, and the solvent was then removed under vacuum. The residue was purified directly by silica gel chromatography, eluting with ethyl acetate/petroleum ether (1:10~1:3 v/v), to give compound 3.

Gram-Scale Synthesis of β-perfluoroalkylated Enamide 3aa

To a Schlenk tube equipped with a magnetic stir bar was charged with enamides 1a (5 mmol, 1.26 g), perfluoroalkyl iodide 2a (15 mmol, 5.19 g), Eosin Y (0.18 g, 5 mol%), and DABCO (2.24 g, 20 mmol). The tube was sealed with a septum, evacuated and backfilled with nitrogen three times. 17.0 mL acetonitrile was added via syringe with gentle stirring. The tube was sealed and stirred under 60 W blue LEDs for 12 h. The resulting mixture was extracted with ethyl acetate. The combined organic phase was dried over anhydrous sodium sulfate, and the solvent was then removed under vacuum. The residue was purified directly by silica gel chromatography, eluting with ethyl acetate/petroleum ether (1:10~1:3 v/v), to give compound 3aa in 72% yield (1.69 g).
General Procedures for the Synthesis of β-difluoroacetylated Enamides

To a Schlenk tube equipped with a magnetic stir bar was charged with enamides 1 (0.3 mmol), ethyl bromodifluoroacetate 4 (121.8 mg, 0.6 mmol, 76.9 μm), fac-Ir(ppy)$_3$ (2.0 mg, 1.0 mol%), and NaHCO$_3$ (75.6 mg, 0.9 mmol). The tube was sealed with a septum, evacuated and backfilled with nitrogen three times. 2.0 mL DMF was added via syringe with gentle stirring. The tube was sealed and stirred under 15 W blue LEDs for 12 h. The resulting mixture was extracted with ethyl acetate. The combined organic phase was dried over anhydrous sodium sulfate, and the solvent was then removed under vacuum. The residue was purified directly by silica gel chromatography, eluting with ethyl acetate/petroleum ether (1:10~1:3 v/v), to give compound 5.

Gram-Scale Synthesis of β-difluoroacetylated Enamide 5a

To a Schlenk tube equipped with a magnetic stir bar was charged with enamides 1a (5 mmol, 1.26 g), ethyl bromodifluoroacetate 4 (10 mmol, 2.03 g, 1.28 mL), Ir(ppy)$_3$ (33.3 mg, 1 mol%), and NaHCO$_3$ (1.26 g, 15 mmol). The tube was sealed with a septum, evacuated and backfilled with nitrogen three times. 34 mL DMF was added via syringe with gentle stirring. The tube was sealed and stirred under 15 W blue LEDs for 12 h. The resulting mixture was extracted with ethyl acetate. The combined organic phase was dried over anhydrous sodium sulfate, and the solvent was then removed under vacuum. The residue was purified directly by silica gel chromatography, eluting with ethyl acetate/petroleum ether (1:10~1:3 v/v), to give compound 5a in 58% yield (1.08 g).
Stern-Volmer Experiment for the β-perfluoroalkylation of Enamides

The Stern-Volmer fluorescence quenching experiments was conducted by the following procedures. Firstly, the emission and excitation spectra of the photocatalyst Eosin Y was investigated. The luminescence quenching experiment was taken using an F97 pro Fluorescence spectrophotometer (Shanghai, China). A solution of Eosin Y (E) (1.0 mM) in DMSO was chosen as the model. The excitation wavelength was 451 nm and the emission intensity was collected at 565 nm.

**b)** Eosin Y emission quenching by DABCO. Linear quenching is observed.

**c)** The fluorescence emission spectra of Eosin Y with different concentration of added quencher (n-C₄F₉)I) excited at 451 nm.

![Image](image4)

**d)** Eosin Y emission quenching by C₄F₉I. No quenching was observed.

**Figure S2 Stern-Volmer experiments for the β-perfluoroalkylation of enamides**

Next, the fluorescence quenching experiment of Eosin Y with DABCO was conducted: In a typical experiment, 1.0 mL of solution of Eosin Y (1.0 mM) in DMSO was added to the appropriate amount of quencher in a screw-top 1.0 cm quartz cuvette, 1 M solution of the quencher (DABCO) was added into the cuvette by 5 μL, and the emission of the sample was collected (**Figure S2a**). The solution was excited at \( \lambda = 451 \) nm (excitation maximum of Eosin Y) and the emission intensity at 565 nm (emission...
maximum of Eosin Y) was observed (Figure S2b).

Subsequently, another Stern–Volmer fluorescence quenching experiment to investigate the influence of $n$-C$_4$F$_9$I was performed. In a typical experiment, 1.0 mL of solution of Eosin Y (1.0 mM) in DMSO was added to the appropriate amount of quencher in a screw-top 1.0 cm quartz cuvette, 1 M solution of the quencher ($n$-C$_4$F$_9$I) was added into the cuvette by 5 μL, and the emission of the sample was collected (Figure S2c). The solution was excited at $\lambda = 451$ nm (excitation maximum of Eosin Y) and the emission intensity at 565 nm (emission maximum of Eosin Y) was observed (Figure S2d).

Stern–Volmer fluorescence quenching experiments demonstrated that the emission intensity of Eosin Y diminished in the presence of DABCO rather than $n$-C$_4$F$_9$I, indicating that the excited Eosin Y* might be reductively quenched by DABCO, instead of the oxidative quenching of the photocatalyst by $n$-C$_4$F$_9$I.

2. For the synthesis of $N$-2-bromophenyl protected enamide 1v, two synthetic steps were involved. Firstly, (Z)-2-bromo-$N$-(1-phenylethylidene)aniline was synthesis through a palladium-catalyzed cross-coupling of 2-bromoaniline with 1-bromostyrene, see: (a) J. Barluenga, M. A. Fernandez, F. Aznar, C. Valdes, Chem. Eur. J., 2004, 35, 494. Secondly, enamide 1v was synthesis via the reaction of (Z)-2-bromo-$N$-(1-phenylethylidene)aniline with benzoyl chloride, see: (b) H. Okamoto, S. Kato, M. Ogasawara, M. Konnai, T. Takematsu, Agric. Biol. Chem. 2014, 55, 2733.
Determination of Stereochernstry-NOESY Experiment of \(E-3\text{aa}\) and \(E-5\text{a}\)

NOESY-experiments of \(E-3\text{aa}\) and \(E-5\text{a}\) were performed to further testify the stereochemistry. It was shown that for both \(E-3\text{aa}\) and \(E-5\text{a}\), a NOE effect between the olefinic hydrogen and the methyl of acetyl group was observed, indicating the \(E\)-configuration of those compounds.
