## Computational details

The computational treatment combines two approaches: preliminary molecular dynamics calculations were performed to explore the potential energy surface of the neutral cage. Notably, the **E** conformation corresponds to an energy minimum extracted from several simulated annealing runs from the optimized experimental structure, using the Amber99 force field of the GROMACS 2020 program.<sup>1a</sup> All the obtained structures were optimized with the MM2 force field implemented in CHEM 3D 19.0 program,<sup>1b</sup> following the procedure specified in the next section.

Reported energies are obtained from Density Functional Theory calculations. All structures were fully optimized by using the functional PBE0,<sup>2</sup> in combination with the D3 dispersion empirical corrections (PBE0-D3).<sup>3</sup> Calculations (optimizations and stationary point characterizations by frequency calculations) were performed by employing the def2-TZVP basis set.<sup>4</sup> The RI-J technique (Resolution of Identity for Coulomb fitting) was employed to reduce the computational cost.<sup>5</sup> DFT calculations were performed with the program package TURBOMOLE.<sup>6</sup>

## Molecular dynamics simulations

Starting from the experimental conformation, several molecular dynamics runs of simulated annealing with 100 cycles were carried out under pressure condition close to zero and a final temperature equal to 298K, starting from the following temperatures: 400, 500, 600, 700, 800, 900 et 1000K. The GROMACS 2020 program was used with the Amber99 force field. 900 conformations were generated and optimized using the MM2 force field implemented in the CHEM 3D program.

An average “pyridine twist” for each optimized conformation was calculated using the following formula:

$$\varphi = \frac{\varphi_1 + \varphi_2 + \varphi_3}{3}$$

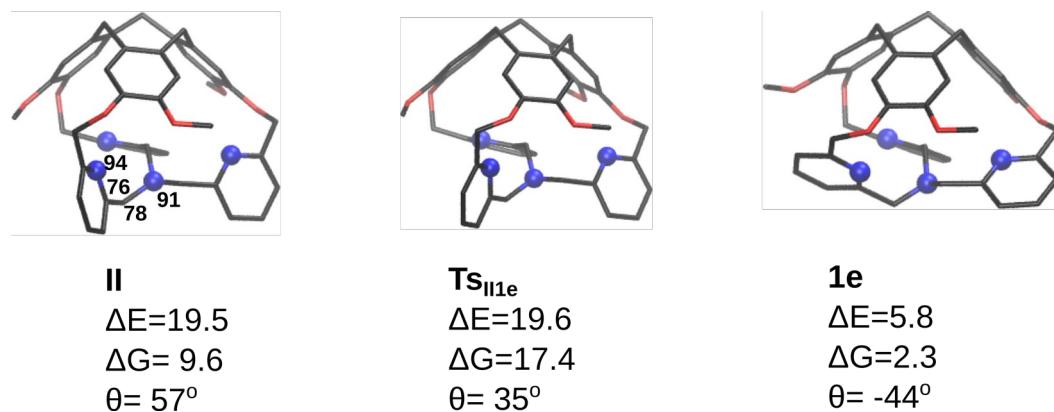

where the  $\varphi_1$ ,  $\varphi_2$  et  $\varphi_3$  are the three O-C-C-N torsion angles. The variation of the energy as a function of the "pyridine twist" is shown in Figure S1. The **E** conformation corresponds to a minimum extracted from the steric energy plotted against the "pyridine twist".

**Figure S1.** Variation of the energy as a function of the "pyridine twist" from molecular dynamics simulations.

## Conversion from **II** to the P/P structure

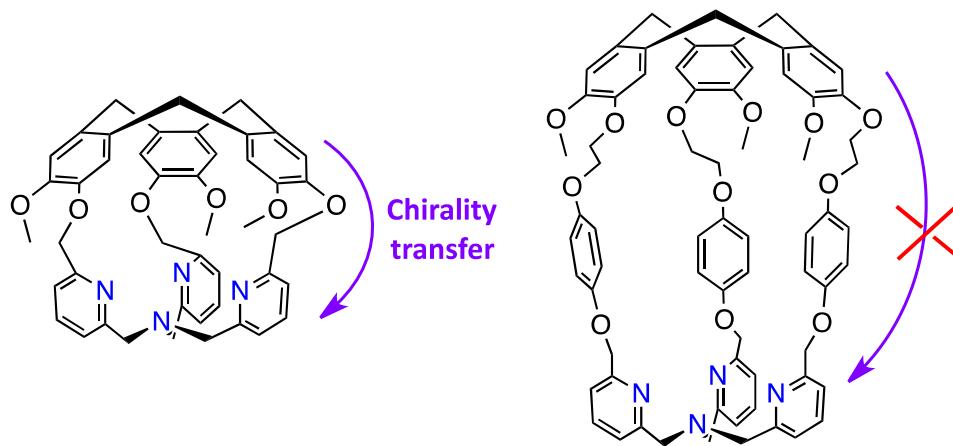

The transition state (xyz coordinates: TsII\_PP.xyz) that leads from **II** to a P/P structure implies a rotation of the pyridine connected to the carbon atom C(78) (torsion angle  $\theta=N(91)-C(78)-C(76)-N(94)$ ), resulting into intermediate **1e** (a P/P structure that is also an intermediate in Path **AE**), as depicted here below. The latter can convert into **A** as shown in Figure 6 of the main article.

**Figure S2.** Computed structures for the conversion of **II** to **1e**.  $\Delta E$  (including ZPE) and  $\Delta G$  (kJ/mol) are relative to P/P-**1** (Figure 2 of the main article).  $\theta$  is the torsion angle:  $\theta=N(91)-C(78)-C(76)-N(94)$ .

## Structure of a TPA-based hemicryptophane

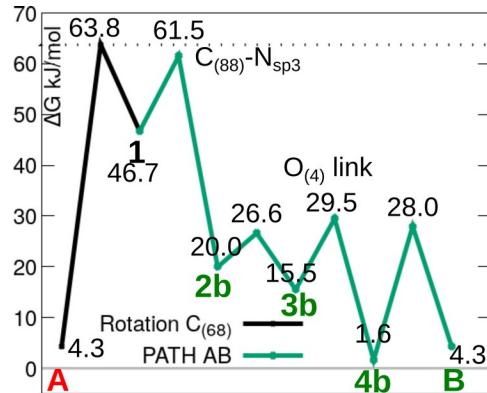

For the TPA-based hemicryptophane of Figure S2, owing phenyl linkages, no chirality transfer was observed between the CTV and the southern TPA unit while the phenyl linkers were helically arranged (see reference: S. A. Ikbal, C. Colomban, D. Zhang, M. Delecluse, T. Brotin, V. Dufaud, J. P. Dutasta, A. B. Sorokin and A. Martinez, *Inorg. Chem.*, 2019, **58**, 7220-7228).

**Figure S3.** Schematic representation of cage-1 from this work and a bigger TPA-based hemicryptophane, owning phenyl linkages.

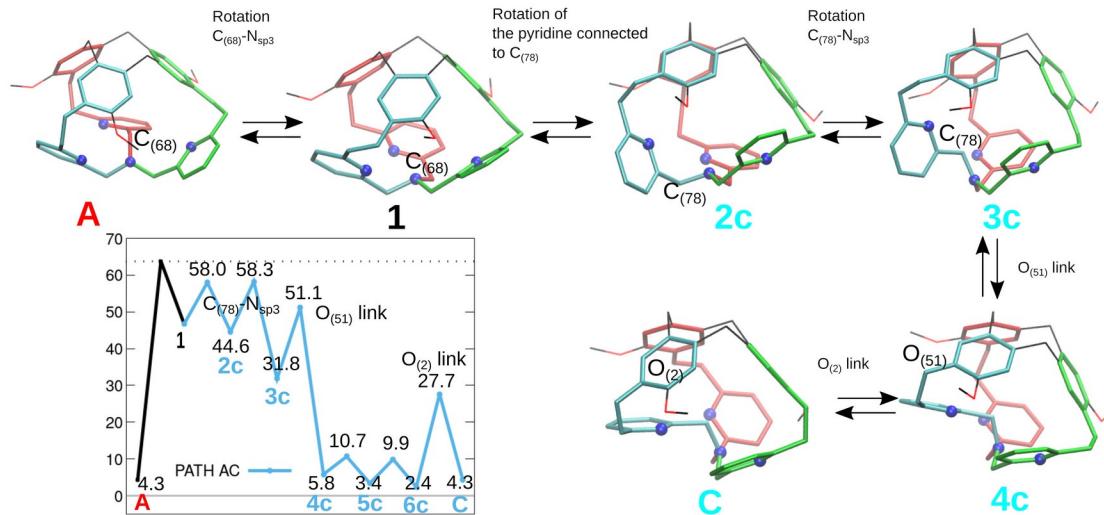

## Paths AB, AC, AD

We present here the detailed pathways for the **AB** (Figure S4), **AC**, and **AD** paths (relative  $\Delta G$  values in kJ/mol, def2-TZVP/D3-PBE0 level).

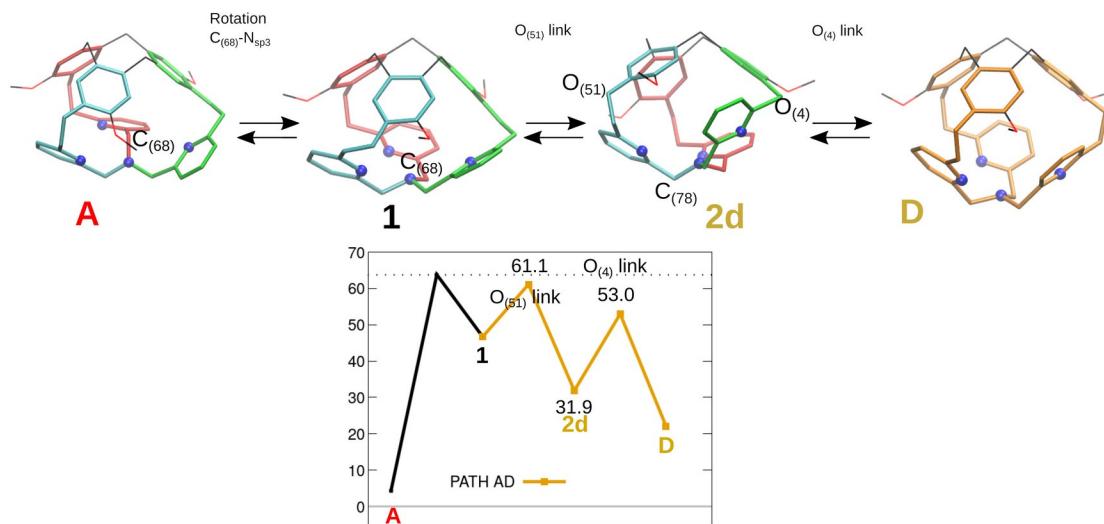

**Figure S4.** Computed Path **AB**, relative  $\Delta G$  (kJ/mol) are indicated for all intermediates and transition states.

For Path **AC** (Figure S5), intermediates **2c** and **4c** are depicted: from **1**, the rotation of the  $C_{(78)}-N_{sp3}$  arm is accomplished in a two-step mechanism: firstly the pyridine ring connected to  $C_{(78)}$  undergoes a rotation, leading to **2c**, which readily converts into **3c** through the rotation of the  $C_{(78)}-N_{sp3}$  arm. In the next step a rotation occurs that adjusts simultaneously the positions of the pyridine rings and the oxygen link of the new inside arm ( $O_{(51)}$ ). From there, the following steps are rearrangements to reorient the OMe groups and the oxygen link  $O_{(2)}$ .

**Figure S5.** Computed Path **AC**, relative  $\Delta G$  (kJ/mol) are indicated for all intermediates and transition states.

For Path **AD** (Figure S6), the intermediate **2d** is shown, resulting from a rotation of the organic link containing O<sub>(51)</sub>.

**Figure S6.** Computed Path **AD**, relative ΔG (kJ/mol) are indicated for all intermediates and transition states.

# Energies and xyz coordinates

Total energies E and ZPE (in a.u.), chemical potentials, relative  $\Delta(E+ZPE)$  and relative  $\Delta G$  (in kJ/mol) are reported for optimized structures at the def2-TZVP/D3-PBE0 level.

Ts0.xyz specifies the transition state that allows for the transformation between the conformations **P/P-1** and **A** of Figure 2 of the main article.

*Table 1: Total electronic energies, ZPE, chemical potentials, relative  $\Delta(E+ZPE)$  and relative  $\Delta G$  energies of all computed stationary points (D3-PBE0/def2-TZVP).*
