General information

Unless otherwise stated, all reagents were purchased from commercial suppliers and used without further purification. All reactions were carried out under air atmosphere using undistilled solvent. Melting points were recorded on an Electrothermal digital melting point apparatus. ^1H , ^{19}F , and ^{13}C NMR spectra were recorded in CDCl_3 on Bruker Avance or Joel 300 or 400 MHz spectrometers. The chemical shifts (δ) are reported in ppm and coupling constants (J) in Hz. High resolution mass spectra (HRMS) were obtained using a commercial apparatus (ESI Source). Column chromatography was generally performed on silica gel (300-400 mesh) and reactions were monitored by thin layer chromatography (TLC) using UV light to visualize the course of the reactions.

General procedure of Vitamin B1-catalyzed aerobic oxidative esterification for the synthesis of products 3

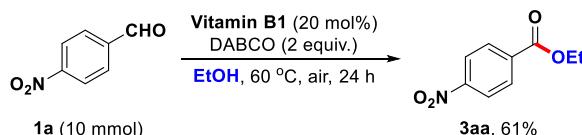

Method 1: A solution of aldehyde (1 mmol), vitamin B1 (60.2 mg, 0.2 mmol), and triethylenediamine (DABCO, 224.3 mg, 2 mmol) in alcohol (2 mL) was stirred at 80 °C under air for 12-24 h. The reaction was then quenched by saturated NH_4Cl solution (20 mL) and extracted with EtOAc (20 mL x 3). The organic layer was washed with saturated brine twice, dried over MgSO_4 , filtered, and concentrated under reduced pressure. The crude product was purified by flash column chromatography (300-400 mesh) using petroleum ether/ethyl acetate (100/1 ~ 2/1) as eluent to afford the pure products **3**.

Method 2: A solution of 4-nitrobenzaldehyde (453.4 mg, 3 mmol), alcohol (1 mmol), vitamin B1 (60.2 mg, 0.2 mmol), and triethylenediamine (DABCO, 224.3 mg, 2 mmol) in acetone (2 mL) was stirred at 60 °C under air for 24 h. The reaction was then quenched by saturated NH_4Cl solution (20 mL) and extracted with EtOAc (20 mL x 3). The organic layer was washed with saturated brine twice, dried over MgSO_4 , filtered, and concentrated under reduced pressure. The crude product was purified by flash column chromatography (300-400 mesh) using petroleum ether/ethyl acetate (100/1 ~ 2/1) as eluent to afford the pure products **3**.

General procedure for the scale-up synthesis of product 3aa

A solution of 4-nitrobenzaldehyde (1.51 g, 10 mmol), vitamin B1 (601.6 mg, 2 mmol), and triethylenediamine (DABCO, 2.24 g, 20 mmol) in EtOH (20 mL) was stirred at 80 °C under air for

24 h. The reaction solvent was removed under reduced pressure, then the reaction mixture was quenched by saturated NH₄Cl solution (20 mL) and extracted with EtOAc (20 mL x 3). The organic layer was washed with saturated brine twice, dried over MgSO₄, filtered, and concentrated under reduced pressure. The crude product was purified by flash column chromatography (300-400 mesh) using petroleum ether/ethyl acetate (100/1 ~ 2/1) as eluent to afford the pure products **3aa** (1.19 g, 61% yield).

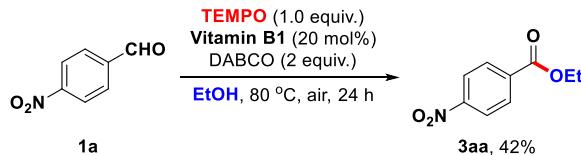

Mechanistic studies

1) Under N₂ atmosphere

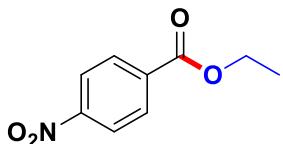

A solution of 4-nitrobenzaldehyde (151.1 mg, 1 mmol), vitamin B1 (60.2 mg, 0.2 mmol), and triethylenediamine (DABCO, 224.3 mg, 2 mmol) in EtOH (2 mL) was stirred at 80 °C under N₂ for 24 h. **Only trace amounts of desired products 3aa were observed. This result suggested that O₂ is important for the desired esterification.**

2) Radical trapping experiment

A solution of 4-nitrobenzaldehyde (151.1 mg, 1 mmol), vitamin B1 (60.2 mg, 0.2 mmol), triethylenediamine (DABCO, 224.3 mg, 2 mmol), and 2,2,6,6-tetramethylpiperidinoxy (TEMPO, 156.3 mg, 1 mmol) in EtOH (2 mL) was stirred at 80 °C under air for 24 h. The reaction was then quenched by saturated NH₄Cl solution (20 mL) and extracted with EtOAc (20 mL x 3). The organic layer was washed with saturated brine twice, dried over MgSO₄, filtered, and concentrated under reduced pressure. The crude product was purified by flash column chromatography (300-400 mesh) using petroleum ether/ethyl acetate (100/1 ~ 20/1) as eluent to afford the pure product **3aa** (82.0 mg, 42% yield). **This result suggested that radical intermediate was not involved in the reaction.**
