Stable isotope dilution assays

Stable isotope dilution assays were performed for two polish beers (Beer #1, Beer#2). A freshly opened beer was degassed for 30 min in ultrasonic cleaner. Then, to aliquots (1.0 mL) of degassed beer, samples of standard solution (**1b**, C = 5.720 mg/L) were added (0.1 mL, 0.2 mL, 0.3 mL, 0.4 mL, 0.5 mL). Prepared in such way samples together with beer samples were analyzed by HPLC-MS in MRM mode (Column: XB-C18, 100×3.0 mm, 2.6 μm, 100 Å; flow: 0.55 mL/min; oven: 35 °C; gradient MeOH/0.1% HCO₂H_(aq): from 50% MeOH to 95% MeOH). Plots of peak areas versus standard concentrations in samples were sketched and concentration of **1a** was determined from the plot as absolute value of zero point.
