### Experimental part

All reagents used are commercially available and the purity of reagents is AR and were used without further purification.

### Synthesis of triptycene porous polymer (TPP)

As shown in Fig. S1, place the monomer triptycene (4mmol, 1.0088g) in a round bottom flask, and then add 1,2-dichloroethane (20mL) to dissolve the monomers. Formaldehyde dimethyl acetal (FDA, 16 mmol) and anhydrous FeCl<sub>3</sub> (16 mmol) were added sequentially to an experimental round bottom flask under nitrogen atmosphere. And after thorough mixing the mixture was heated to 80 °C in an oil bath and then the reaction was continued with magnetic stirring for 24 hours. After the reaction is over, cool to room temperature, collect the crude product by filtration, and wash with methanol for several times until the filtrate is almost colorless. Then, the filtered crude product was purified by Soxhlet extraction with methanol for 24 hours, and it was vacuum dried at 80 °C for 6 hours to obtain powder TPP (yield:71.69%).

Fig. S1 The schematic representation of synthesis route of triptycene porous polymer TPP

## Synthesis of the pyrrole porous polymer (PP)

As shown in Fig. S2, the monomer pyrrole (4mmol, 0.2775mL) in a round bottom flask, and then add 1,2-dichloroethane (20mL) to dissolve the monomers. Formaldehyde dimethyl acetal (FDA, 16 mmol) and anhydrous FeCl<sub>3</sub> (16 mmol) were added sequentially to an experimental round bottom flask under nitrogen atmosphere. And after thorough mixing the mixture was heated to 80 °C in an oil bath and then the reaction was continued with magnetic stirring for 24 hours. After the reaction is over, cool to room temperature, collect the crude product by filtration, and wash with methanol for several times until the filtrate is almost colorless. Then, the filtered crude product was purified by Soxhlet extraction with methanol for 24 hours, and it was vacuum dried at 80 °C for 6 hours to obtain powder PP (yield:84.6%).

## Synthesis of TPP-PP in different proportions

This experiment discusses the adsorption performance of synthetic materials in different ratios. The molar ratio of monomer triptycene and pyrrole is adjusted to 1:1; 1:2; 2:1; 3:2.

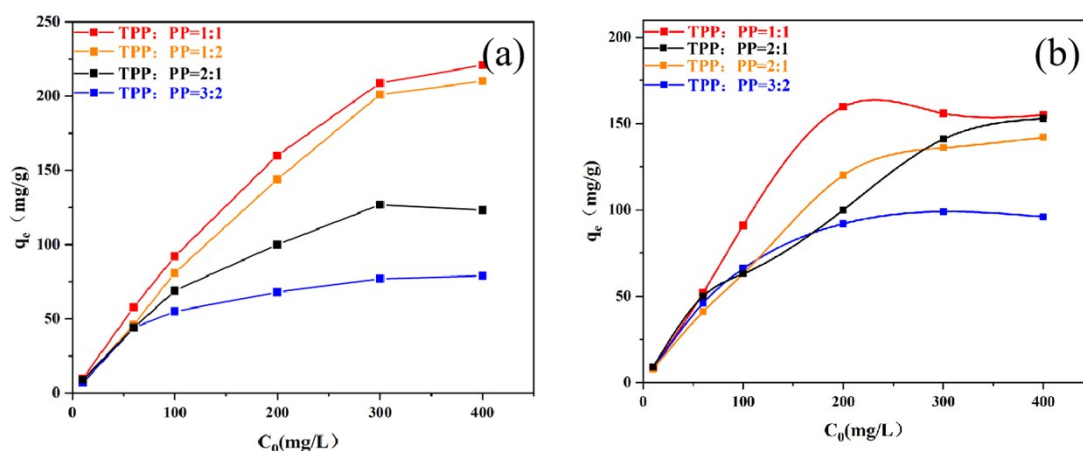

Place the monomer triptycene (4mmol, 1.0088g) and pyrrole (4mmol, 0.2775mL) in a round bottom flask, and then add 1,2-dichloroethane (20mL) to dissolve the monomers. Formaldehyde dimethyl acetal (FDA, 16 mmol) and anhydrous FeCl<sub>3</sub> (16 mmol) were added sequentially to an experimental round bottom flask under nitrogen atmosphere. And after thorough mixing the mixture was heated to 80 °C in an oil bath and then the reaction was continued with magnetic stirring for 24 hours. After the reaction is over, cool to room temperature, collect the crude product by filtration, and wash with methanol for several times until the filtrate is almost colorless. Then, the filtered crude product was purified by Soxhlet extraction with methanol for 24 hours, and after Soxhlet extraction, it was vacuum dried at 80° C for 6 hours to obtain powder TPP-PP (1:1).

Place the monomer triptycene (4mmol, 1.0088g) and pyrrole (8mmol, 0.555mL) in a round bottom flask, and then add 1,2-dichloroethane (20mL) to dissolve the monomers. Formaldehyde dimethyl acetal (FDA, 16 mmol) and anhydrous FeCl<sub>3</sub> (16 mmol) were added sequentially to an experimental round bottom flask under nitrogen atmosphere. And after thorough mixing the mixture was heated to 80 °C in an oil bath and then the reaction was continued with magnetic stirring for 24 hours. After the

reaction is over, cool to room temperature, collect the crude product by filtration, and wash with methanol for several times until the filtrate is almost colorless. Then, the filtered crude product was purified by Soxhlet extraction with methanol for 24 hours, and after Soxhlet extraction, it was vacuum dried at 80 °C for 6 hours to obtain powder TPP-PP (1:2).

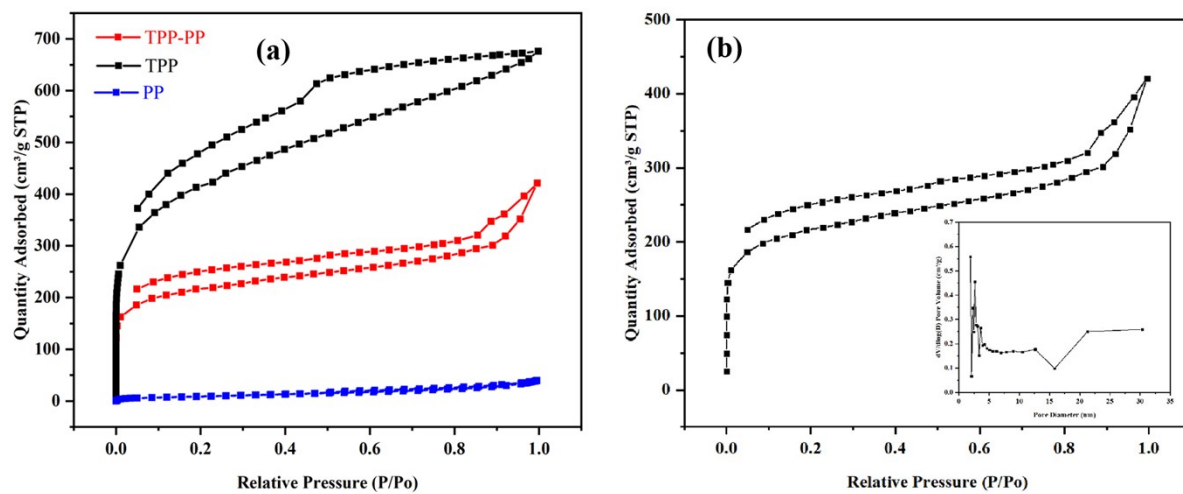

Place the monomer triptycene (2mmol, 0.5044g) and pyrrole (4mmol, 0.2775mL) in a round bottom flask, and then add 1,2-dichloroethane (20mL) to dissolve the monomers. Formaldehyde dimethyl acetal (FDA, 16 mmol) and anhydrous FeCl<sub>3</sub> (16 mmol) were added sequentially to an experimental round bottom flask under nitrogen atmosphere. And after thorough mixing the mixture was heated to 80 °C in an oil bath and then the reaction was continued with magnetic stirring for 24 hours. After the reaction is over, cool to room temperature, collect the crude product by filtration, and wash with methanol for several times until the filtrate is almost colorless. Then, the filtered crude product was purified by Soxhlet extraction with methanol for 24 hours, and after Soxhlet extraction, it was vacuum dried at 80 °C for 6 hours to obtain powder TPP-PP(2:1).

Place the monomer triptycene (3mmol, 0.7566g) and pyrrole (2mmol, 0.1388mL) in a round bottom flask, and then add 1,2-dichloroethane (20mL) to dissolve the monomers. Formaldehyde dimethyl acetal (FDA, 16 mmol) and anhydrous FeCl<sub>3</sub> (16 mmol) were added sequentially to an experimental round bottom flask under nitrogen atmosphere. And after thorough mixing the mixture was heated to 80°C in an oil bath and then the reaction was continued with magnetic stirring for 24 hours. After the reaction is over, cool to room temperature, collect the crude product by filtration, and wash with methanol for several times until the filtrate is almost colorless. Then, the filtered crude product was purified by Soxhlet extraction with methanol for 24 hours, and after Soxhlet extraction, it was vacuum dried at 80 °C for 6 hours to obtain powder TPP-PP(3:2).

## BET

**Fig. S4** (a) N<sub>2</sub> adsorption-desorption isotherms of TPP-PP, TPP, PP at 77K; (b) N<sub>2</sub> adsorption-desorption isotherms and pore size distributions (in the inset of (d)) of TPP-PP

## SEM and TEM

The following figure shows the SEM and TEM plot of the TPP and PP.

**Fig. S5** (a)(b)SEM and TEM images of TPP; (c)(d)SEM and TEM images of PP

## NMR analysis of TPP-PP

The NMR analysis of polymer TPP-PP is shown in Fig. S3. The peak at 54 ppm is two bridging carbon atoms a in triptycene; the absorption peak at 104 ppm corresponds to two carbon atoms b in pyrrole opposite to the amino group. It shows that pyrrole was successfully cross-linked on triptycene; the absorption peaks at 128.63 ppm and 144 ppm are aromatic carbon on triptycene; the absorption peak at 178ppm may be the resonance peak of c/d.

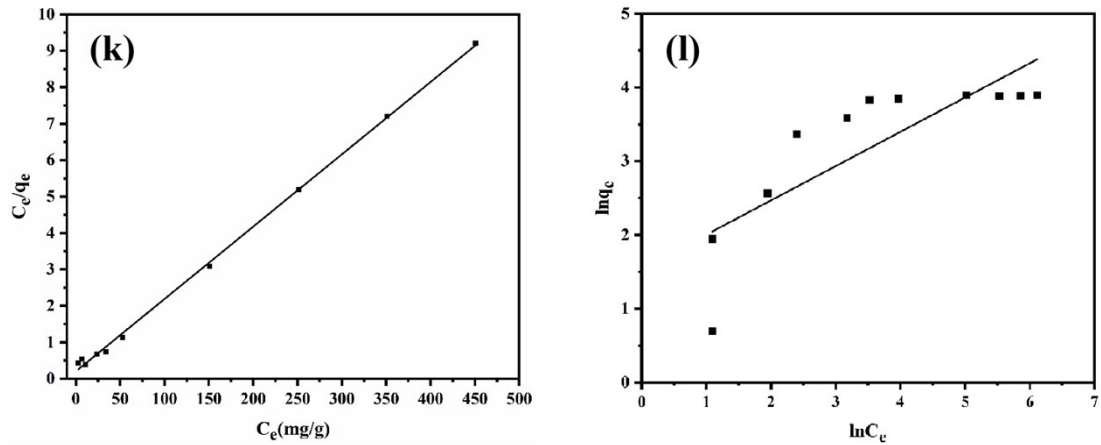

Fig. S6 NMR chart of TPP-PP

## The isothermal adsorption model

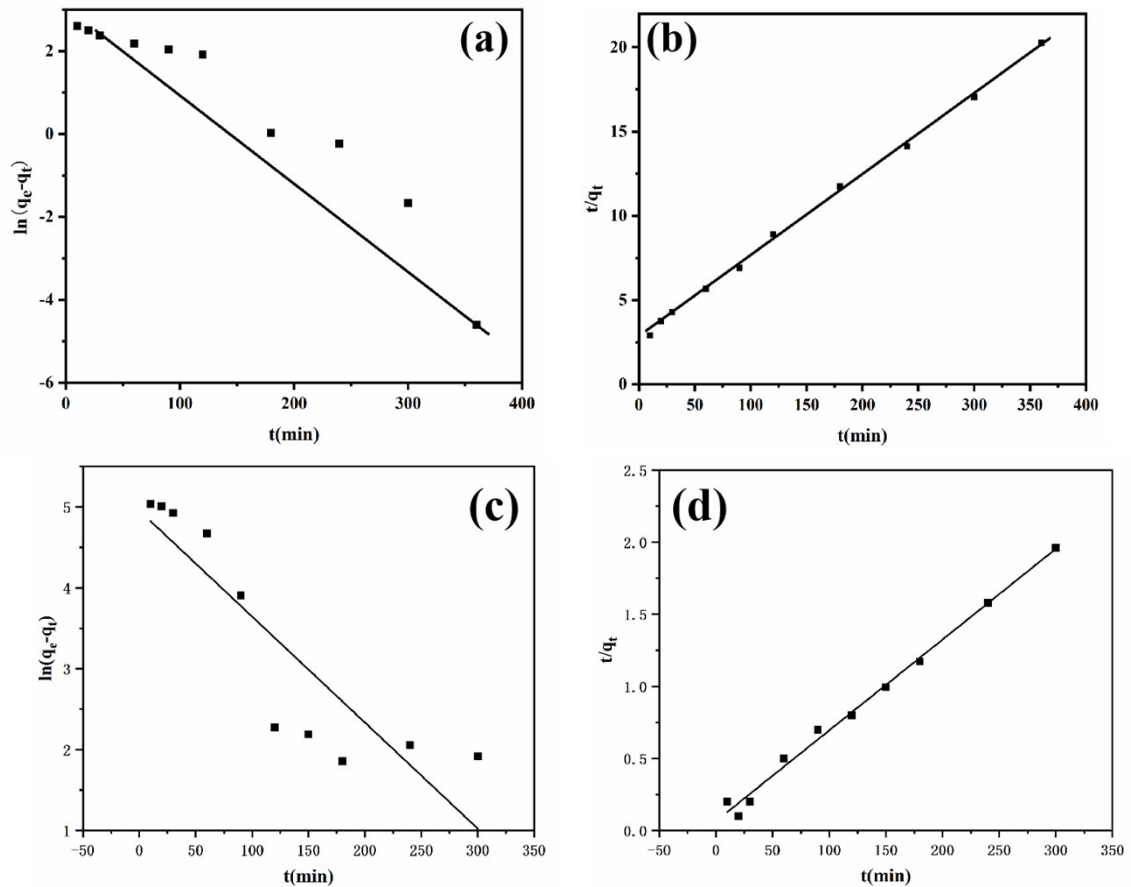

**Fig. S7** (a)(b)(c)(d)(e)(f) are the Langmuir and Freundlich adsorption models of TPP-PP, TPP, and PP on MO respectively, (g)(h)(i)(j)(k)(l) are the Langmuir and Freundlich adsorption models of TPP-PP, TPP, and PP on MB respectively

## Dynamics adsorption

In kinetic studies, fitting the kinetic data with the quasi-primary and quasi-secondary kinetic models yields the following data showing that the adsorption process of TPP-PP, TPP and PP can be well described by the quasi-secondary kinetic model.

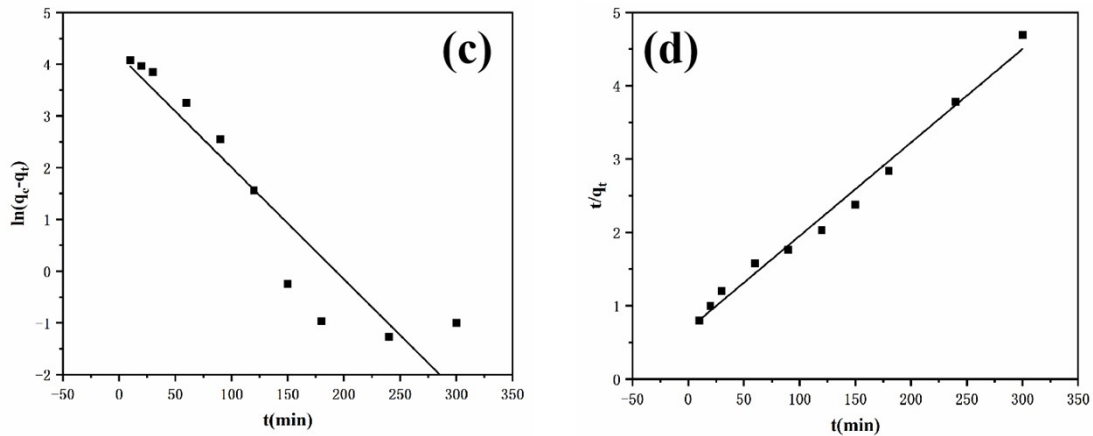

**Fig.S8** (a)(b) is the quasi-first-order kinetic model and quasi-second-order kinetic model of TPP-PP for MO, (c)(d) is the quasi-first-order kinetic model and quasi-second-order kinetic model of TPP-PP for MB

**Fig.S9** (a)(b) is the quasi-first-order kinetic model and quasi-second-order kinetic model of TPP for MO, (c)(d) is the quasi-first-order kinetic model and quasi-second-order kinetic model of TPP for MB

**Fig.S10** (a)(b) is the quasi-first-order kinetic model and quasi-second-order kinetic model of PP for MO, (c)(d) is the quasi-first-order kinetic model and quasi-second-order kinetic model of PP for MB
