## Supplementary Information

# A simulation study of self-assembly of ABC star terpolymers confined between two parallel surfaces 

Zhiyao Liu, Zheng Wang, Yuhua Yin, Run Jiang, and Baohui Li*

Table S1 The estimated characteristic length $L_{1}$ values as functions of $x\left(x=N_{\mathrm{C}} / N_{\mathrm{A}}, N_{\mathrm{A}}=N_{\mathrm{B}}\right)$ and $\lambda$ $\left(\lambda=\varepsilon_{\mathrm{AC}} / \varepsilon_{\mathrm{AB}}, \varepsilon_{\mathrm{AC}}=\varepsilon_{\mathrm{BC}}\right)$ for phases listed in Fig. 1.

$$

$D / L_{1}=0.56 \quad 0.72-1.2 \quad 1.36-2.16 \quad$ 2.16-2.48

Fig. S1 Phase sequences as a function of $D / L_{1}$ for the bulk $[L+C]$-forming star terpolymers $\mathrm{A}_{6} \mathrm{~B}_{6} \mathrm{C}_{12}$ with $\lambda=2$ in the thin films at different surface filed: (a) $\varepsilon_{\mathrm{AS}}=1.0, \varepsilon_{\mathrm{BS}}=0.3, \varepsilon_{\mathrm{CS}}=0.2$; (b) $\varepsilon_{\mathrm{AS}}=1.0, \varepsilon_{\mathrm{BS}}=0$, $\varepsilon_{\mathrm{CS}}=0.5$. Oblique views of A- and B- domains are shown. Color scheme: A (blue), B (green).

Fig. S2 Variations of normalized (a) interface energy, (b) mean-square radius of gyration, (c) surface energy and (d) total energy with $D / L_{1}$ for terpolymers $\mathrm{A}_{6} \mathrm{~B}_{6} \mathrm{C}_{12}$ with $\lambda=2\left(\varepsilon_{\mathrm{AB}}=1.0, \varepsilon_{\mathrm{AC}}=\varepsilon_{\mathrm{BC}}=2.0\right)$. $<R g_{\text {Bulk }}^{2}>$ is the mean-square radius of gyration for the corresponding bulk phase. $E_{\mathrm{ABC}} / D=\left(\varepsilon_{\mathrm{AB}} \times n_{\mathrm{AB}}+\varepsilon_{\mathrm{AC}} \times n_{\mathrm{AC}}+\varepsilon_{\mathrm{BC}} \times n_{\mathrm{BC}}\right) / D, E_{\mathrm{SS}} / D=\left(\varepsilon_{\mathrm{CS}} \times n_{\mathrm{CS}}\right) / D, n_{\mathrm{AB}}, n_{\mathrm{AC}}, n_{\mathrm{BC}}$ and $n_{\mathrm{CS}}$ are the average of the contact number between segments A and $\mathrm{B}, \mathrm{A}$ and $\mathrm{C}, \mathrm{B}$ and C , and surfaces and C, respectively. $E=E_{\mathrm{SS}}+E_{\mathrm{ABC}}$. Some snapshots obtained at $\varepsilon_{\mathrm{CS}}=-1.0$ and $\varepsilon_{\mathrm{CS}}=1.0$ are also shown in (a) and (b), respectively.

Fig. S3 (a) A schematic illustration of the characteristic lengths $L_{1}$ and $L_{2}$ in a [8.8.4] phase. Phase sequences as a function of $D / L_{1}$ for the bulk [8.8.4]-forming star terpolymers $\mathrm{A}_{6} \mathrm{~B}_{6} \mathrm{C}_{4}$ with $\lambda=0.5$ in the thin films at different $\varepsilon_{\mathrm{AS}}$ values. (b) $\varepsilon_{\mathrm{AS}}=0.2$, (c) $\varepsilon_{\mathrm{AS}}=0.5$, (d) $\varepsilon_{\mathrm{AS}}=-0.2$, (e) $\varepsilon_{\mathrm{AS}}=-0.5$. Top view is given for phase $[8.8 .4]^{\perp}$, side view is given for parallel phases 'and oblique view is given for phases with A-wetting layers.

Fig. S4 Phase diagrams in space of arm length ratio $x=N_{\mathrm{C}} / N_{\mathrm{A}}\left(N_{\mathrm{A}}=N_{\mathrm{B}}\right)$ and film thickness $D$ for ABC star terpolymers with $\quad \lambda=0.5\left(\varepsilon_{\mathrm{AC}}=\varepsilon_{\mathrm{BC}}=1.0, \varepsilon_{\mathrm{AB}}=2.0\right)$ confined between neutral surfaces.
