## General Remarks

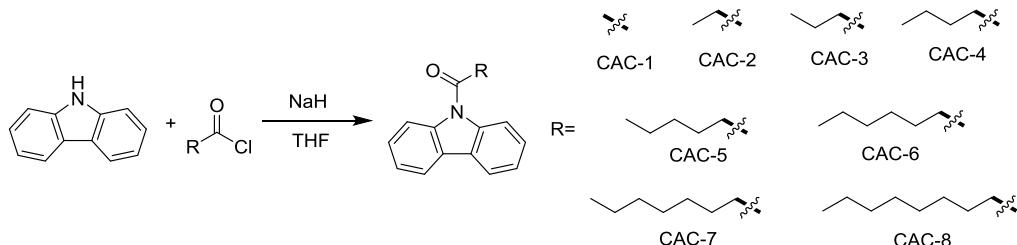

### Reagents and materials

Unless otherwise noted, all reagents used in the experiments are purchased from commercial sources without further purification. Carbazole is purchased from Damas-beta. For flash column chromatography, silica gel with 200 ~ 300 mesh is used. Sodium hydride is purchased from Innochem, which accounts for 60% dispersed in mineral oil.

### Measurements

Analytical thin-layer chromatography (TLC) was performed using precoated TLC plates with silica gel GF-254. Nuclear magnetic resonance ( $^1\text{H}$  and  $^{13}\text{C}$  NMR) spectra were obtained on a Bruker Ultra Shield plus 400 MHz spectrometer. Resonance patterns are reported with the notation s (singlet), d (double), t (triplet), q (quartet), and m (multiplet). Melting points were recorded on WRS-2C melting point meter. Thermogravimetric analyses (TGA) were recorded with a NETZSCH TG 209F3 thermal analyzer under nitrogen atmosphere with a heating rate of  $20\text{ }^\circ\text{C min}^{-1}$ . High-performance liquid chromatogram spectrum was recorded on Agilent 1100 HPLC. UV-vis spectra were performed on a Shimadzu UV-2600. The powder X-ray diffraction patterns were recorded by RIGAKU SMARTLAB9KW with an X-ray source of Cu  $\text{K}\alpha$  ( $\lambda = 1.5418\text{ \AA}$ ) at 298 K at 50 KV and 15 mA at a scan rate of  $7^\circ(20)\text{ min}^{-1}$  (scan range: 5-50°). X-ray Single crystal diffraction for compounds data was performed on a diffractometer with CCD detector using Cu  $\text{K}\alpha$  radiation ( $\lambda = 1.5418\text{ \AA}$ ) source. Steady-state photoluminescence (PL) was measured by Hitachi F-4700. The lifetime and time-resolved emission spectra and PL quantum yield (PLQY) were obtained on Edinburgh FLS1000 fluorescence spectrophotometer. Luminescent photos and videos were taken by Huawei phone.

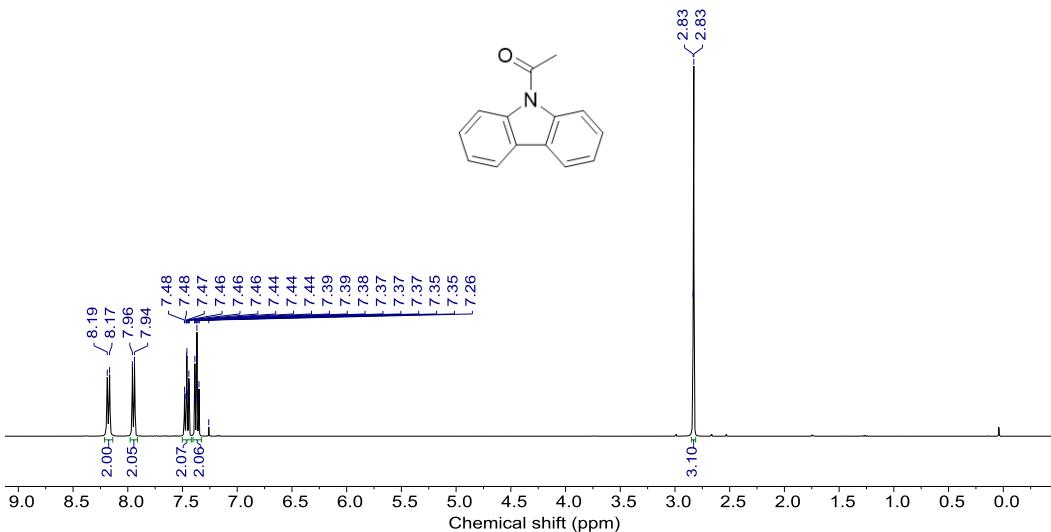

### Synthesis and Characterization

#### 1-(9H-carbazol-9-yl)ethan-1-one (CAC-1)

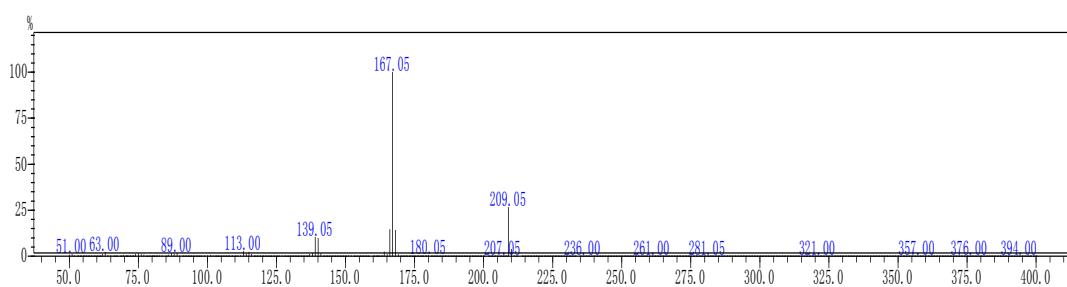

Carbazole (1.67 g, 10 mmol) and NaH (0.29 g, 12 mmol) were added into dry tetrahydrofuran (THF) solution (20 mL) at room temperature. After stirring for 30 min, the mixture was added dropwise to THF solution (20 mL) of acetyl chloride (1.07 mL, 15 mmol) at  $0\text{ }^\circ\text{C}$ . The mixture was further stirred for 5 h at room temperature before the reaction was quenched by pouring into water. The organic layer was extracted with  $\text{CH}_2\text{Cl}_2$  for three times and dried with  $\text{Na}_2\text{SO}_4$ . After the solvent was removed by rotary evaporation, the residue was purified by column chromatography to give product as white solid (1.54 g, 78.2%).  $^1\text{H}$  NMR (400 MHz, Chloroform- $d$ )  $\delta$  8.14 (d,  $J = 8.4\text{ Hz}$ , 2H), 7.91 (d,  $J = 7.7\text{ Hz}$ , 2H), 7.42 (ddd,  $J = 8.5, 7.3, 1.3\text{ Hz}$ , 2H), 7.33 (td,  $J = 7.4, 1.0\text{ Hz}$ , 2H), 2.79 (d,  $J = 2.4\text{ Hz}$ , 3H).  $^{13}\text{C}$  NMR (101 MHz,  $\text{CDCl}_3$ )  $\delta$  170.05, 138.59, 127.32, 126.3, 123.65, 119.81, 116.24, 27.75. ### Lab-carbazole (L-Cz)

2-Chloro-N-phenylaniline (7.5 g, 36.8 mmol), t-BuONa (17.68 g, 184 mmol), Pd(OAc)<sub>2</sub> (0.2 g, 1.0 mmol), and HP<sup>t</sup>Bu<sub>3</sub>•BF<sub>4</sub> (0.53 g, 1.8 mmol) were suspended in dioxane (200 mL) under the protection of nitrogen. The mixture was heated to reflux (110 °C) for 18 h under magnetic stirring before quenched by addition of HCl (aq) (2 M, 20 mL). The organic phase was extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 × 40 mL), and removed by rotatory evaporation after dried over by Na<sub>2</sub>SO<sub>4</sub>. The crude product was purified by column chromatography with petroleum ether and dichloromethane as eluent (V/V, 10/1), followed by recrystallized in toluene several times to give pure product as a pure white solid with 1.52 g. <sup>1</sup>H NMR (400 MHz, DMSO-*d*<sub>6</sub>) δ 11.25 (s, 1H), 8.13 – 8.08 (m, 2H), 7.48 (dt, *J* = 8.1, 0.9 Hz, 2H), 7.37 (ddd, *J* = 8.2, 7.1, 1.2 Hz, 2H), 7.15 (ddd, *J* = 8.0, 7.1, 1.0 Hz, 2H).

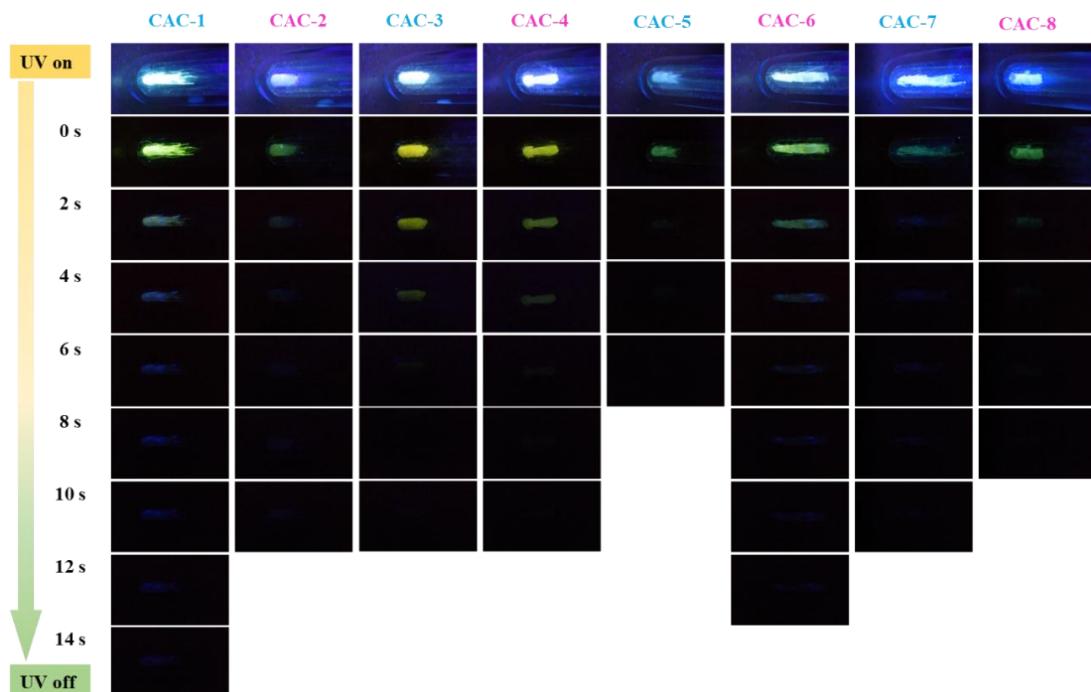

**Fig. S32** Time-resolved PL decay profiles of CAC-*N* (*N* = 1~8) crystals under 298 K,  $\lambda_{\text{Ex}}=310$  nm.

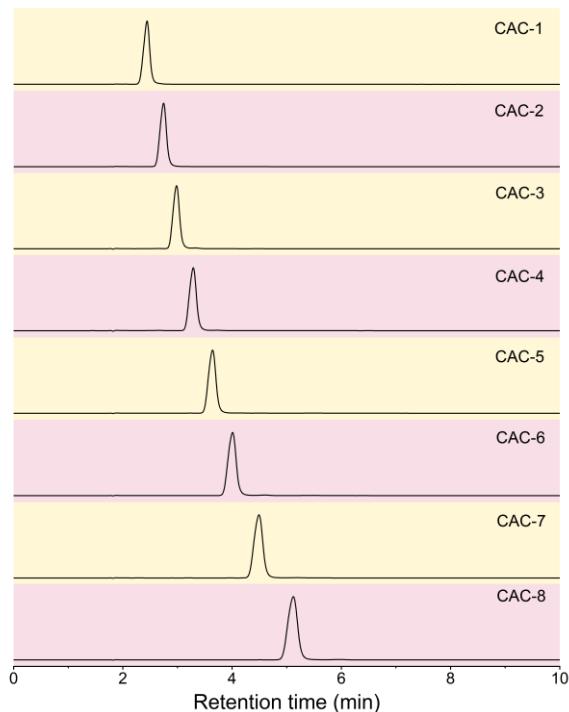

**Fig. S33** (A) In the PL of CAC-2, CAC-4, CAC-6 and CAC-8 crystals, the visible emission ( $\lambda > 400$  nm) area is account for 13.4%, 21.9%, 16.4% and 8.3%; (B) in ML of CAC-4, CAC-6 and CAC-8 crystals, the visible emission area is account for 32.9%, 28.8% and 3.9%. The emission with wavelength larger than 400 nm is defined as visible emission. The proportion of visible emission is calculated as visible emission peak area ( $A_{\lambda > 400}$ ) versus the total spectrum peak area ( $A_{PL}$ ,  $A_{ML}$ ), which is calculated by Origin program (version 2016).
