

Fig. S1: (a-e) Temperature dependence of the relative permittivity, (f-j) the differential permittivity, and (k-o) the loss tangent ($\tan\delta$) for (CS)AM-x ($x = 0.00 - 0.20$). The results measured at the test frequencies of 10^3 , 10^4 , and 10^5 Hz are plotted for the relative permittivity and $\tan\delta$. For the differential permittivity, on the other hand, the results at 10^6 Hz are displayed.
