Instruments

Ultrapure water was prepared by Milli Q Advantage A10 ultrapure water system and was used to prepare all solutions. The ultraviolet-visible absorption spectrum and fluorescence spectrum were measured by Shimadzu UV 3600 ultraviolet-visible spectrometer and PerkinElmer LS 55 fluorescence spectrometer, respectively. Fluorescence quantum yield and fluorescence lifetime were tested by Edinburgh FLS980 steady-state transient fluorescence spectrometer. All NMR spectra were measured by Bruker AVANCE III 400 MHz with tetramethylsilane (TMS) as the internal standard. All mass spectra were obtained by Thermo Fisher Q Exactive high resolution mass spectrometer. All cell viability was measured by MTT method using Thermo Scientific Varioskan R Flash full-wavelength scanning multi-function reader. Biological imaging experiments were performed by Zeiss LSM 710 laser confocal fluorescence microscope.

Preparation for the experiment

The stock solution of HBTN (10 mM) was prepared using DMF. All analytical substances (HOCl, Cys, Hcy, GSH, Asp, Glu, Gly, His, Leu, Lys, Pro, Ser, Thr, Trp, Tyr, Val, Cu^{2+} , Zn^{2+} , Mg^{2+} , Ca^{2+} , Fe^{3+} , Cu^{2+} , Zn^{2+} , Mg^{2+} , Ca^{2+} , Fe^{3+} , Ac^- , SO_3^{2-} , SO_4^{2-} , $\text{S}_2\text{O}_3^{2-}$, S^{2-} , CO_3^- , Br, I, Cl, ONOO^- , H_2O_2 , $\cdot\text{OH}$, $^1\text{O}_2$, O_2^- , NO_2^- , NO_3^-) were prepared in ultrapure water. Probe HBTN was used at a working concentration of 10 μM (0.1% DMF) for spectroscopic testing and bioimaging.

Synthesis of compound HBTOH

2-Hydroxy-5-methylbenzaldehyde (2.72 g, 20.0 mmol), 2-aminobenzenethiol (2.14 g, 20.0 mmol), sodium metabisulfite (3.80 g, 20.0 mmol) and 30 mL DMF were added to 100 mL single-necked flask, then refluxed for 1.5 h. After the reaction was completed, the reaction solution was cooled to room temperature. It was then added to 100 mL of secondary water, resulting in an obvious solid, and the crude product was obtained by suction filtration. Purification using column chromatography (eluent: petroleum ether/ethyl acetate = 1:1) gave compound HBT-OH (3.88 g, 80%) as a white solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ 11.37 (s, 1H), 8.12 (d, *J* = 7.9 Hz, 1H), 8.05 (d, *J* = 8.1 Hz, 1H), 7.96 (d, *J* = 1.2 Hz, 1H), 7.53 (ddd, *J* = 8.3, 7.2, 1.3 Hz, 1H), 7.43 (ddd, *J* = 8.2, 7.2, 1.2 Hz, 1H), 7.22 (dd, *J* = 8.4, 2.2 Hz, 1H), 6.98 (d, *J* = 8.3 Hz, 1H), 2.31 (s, 3H). ¹³C NMR (100 MHz, DMSO-*d*₆) δ 165.34, 154.19, 151.45, 134.22, 133.22, 128.39, 128.26, 126.42, 125.01, 122.03, 121.96, 117.89, 116.87, 20.02. HRMS (ESI): calcd for C₁₄H₁₀NOS⁻ [M - H]⁻ m/z, 240.0478; found, 240.0485.

Synthesis of compound HBTOF

A mixture of HBT-OH (3.52 g, 14.6 mmol), HMTA (5.12 g, 36.5 mmol) and trifluoroacetic acid (20 mL) was added to a 100 mL single-neck flask, and the mixture was refluxed at 80 °C for 24 h. After cooling to room temperature, a pale-yellow solid precipitated out as the pH was adjusted to neutrality with NaOH solution. The crude product was obtained by suction filtration. We purified it by column chromatography (eluent: dichloromethane) to obtain compound HBTOF (3.29 g, 84%) as a pale-yellow

solid. ^1H NMR (400 MHz, $\text{DMSO-}d_6$) δ 12.74 (s, 1H), 10.33 (s, 1H), 8.24 - 8.17 (m, 2H), 8.12 (dt, $J = 8.1, 1.0$ Hz, 1H), 7.73 (dd, $J = 2.3, 0.9$ Hz, 1H), 7.60 (ddd, $J = 8.2, 7.2, 1.3$ Hz, 1H), 7.51 (ddd, $J = 8.3, 7.2, 1.2$ Hz, 1H), 2.39 (s, 3H). ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$) δ 191.82, 165.17, 157.03, 150.99, 135.28, 133.56, 133.10, 129.31, 126.95, 125.84, 123.24, 122.32, 122.28, 119.12, 19.75. HRMS (ESI): calcd for $\text{C}_{15}\text{H}_{10}\text{NO}_2\text{S}^-$ $[\text{M} - \text{H}]^-$ m/z , 268.0427; found, 268.0439.

Synthesis of compound HBTDF

The HBTOF (1.00 g, 3.72 mmol) was dissolved in toluene (30 mL) and then (triphenylphosphoranylidene)acetaldehyde (1.25 g, 4.10 mmol) was added. After the mixture was reacted at 60 °C for 7 h, the solvent was removed. The solid was purified using column chromatography (eluent: dichloromethane) to give compound HBTDF (1.06 g, 96%) as a yellow solid. ^1H NMR (400 MHz, $\text{DMSO-}d_6$) δ 13.09 (s, 1H), 9.72 (d, $J = 7.8$ Hz, 1H), 8.22 (d, $J = 8.1$ Hz, 1H), 8.13 (d, $J = 8.4$ Hz, 1H), 7.98 (d, $J = 16.1$ Hz, 1H), 7.80 (dd, $J = 13.4, 1.6$ Hz, 2H), 7.61 (ddd, $J = 8.3, 7.2, 1.3$ Hz, 1H), 7.53 (ddd, $J = 8.3, 7.2, 1.2$ Hz, 1H), 6.97 (dd, $J = 16.0, 7.8$ Hz, 1H), 2.37 (s, 3H). ^{13}C NMR (100 MHz, $\text{DMSO-}d_6$) δ 194.84, 168.27, 154.01, 150.82, 146.97, 132.78, 132.45, 131.65, 129.40, 129.19, 127.18, 126.12, 122.53, 122.43, 122.05, 117.11, 19.82. HRMS (ESI): calcd for $\text{C}_{17}\text{H}_{12}\text{NO}_2\text{S}^-$ $[\text{M} - \text{H}]^-$ m/z , 294.0583; found, 294.0595.

Table S1. The photophysical properties of HBTN, HBTN + glycerol and HBTN + HOCl.

Samples	$\lambda_{\text{max abs}}(\text{nm})$	$\epsilon(\text{M}^{-1}\cdot\text{cm}^{-1})$	$\lambda_{\text{max em}}(\text{nm})$	$\Delta\lambda(\text{nm})$	Φ_{F}	$B(\text{M}^{-1}\cdot\text{cm}^{-1})$	$\tau(\text{ns})$
HBTN	402	22525	680	278	0.0460	1036	5.465
HBTN + glycerol (100%)	419	24400	680	261	0.1943	4741	8.839

HBTN + HOCl	288	14915	530	242	0.0324	483	4.421
-------------	-----	-------	-----	-----	--------	-----	-------

$\lambda_{\text{max abs}}$: Maximum absorbance wavelength. ϵ : Molar extinction coefficient. $\lambda_{\text{max em}}$: Maximum emission wavelength. $\Delta\lambda$: Stokes shift. Φ_{F} : Fluorescence quantum yield. B : Brightness. The brightness was calculated using $B = \epsilon \times \Phi_{\text{F}}$. τ : Fluorescence lifetime. Fluorescence quantum yield and fluorescence lifetime were tested by Edinburgh FLS980 steady-state transient fluorescence spectrometer.

Table S2. Comparison of fluorescent probe for viscosity and HOCl.

Probes	Emission peak	Stokes shift	Subcellular localization	Bioimaging	Reference
HBTN	680 nm/530 nm	278 nm	Mitochondrial targeting	MCF-7 cells and zebrafish	This work
