1. General Detail

Hydrogenation reactions were performed in an autoclave under an atmosphere of hydrogen. All air- and moisture-sensitive reactions were performed in dried glassware under an atmosphere of nitrogen. Solvents used in the glove box were dried and degassed by standard procedures. Melting points were measured with SGW X-4 micro melting point apparatus and the thermometer was uncorrected. All commercially available reagents were used without further purification. Column chromatography was performed using silica gel (100-200 mesh). ¹H NMR, ¹³C NMR and ¹⁹F NMR spectra were recorded on a Bruker Ascend TM 400 (400 MHz, 100 MHz and 376 MHz, respectively). High resolution mass spectra (HRMS) were performed on a Fourier-transform mass spectrometry at the Instrumental Analysis Center of Shanghai Jiao Tong University. Enantioselectivity was measured by a high performance liquid chromatography (HPLC) using Daicel Chiral column IA, IB-3, IE, OJ-H, OD-H, AD-H or OX columns with *n*-hexane/*i*-PrOH as eluent. X-ray single crystal diffraction data were collected on a Bruker D8 VENTURE CMOS photon 100 diffractometer with helios mx multilayer monochrmator Cu K α radiation ($\lambda = 1.54178 \text{ \AA}$) at the Instrumental Analysis Center of Shanghai Jiao Tong University.

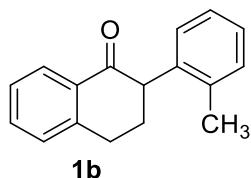

2. Preparation of Substrates

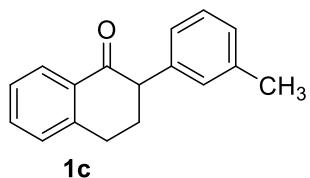

The substrates **1 were prepared by following literature procedures:**^[1] Under a N_2 atmosphere, to a 100 mL of three-necked flask equipped with a magnetic stir bar were added $Pd_2(dbu)_3$ (1.5 mol%), tBu_3PHBF_4 (6 mol%) and $NaOH$ (2.0 equiv). Then α -tetralone (1.0 equiv), ArBr (1.2 equiv), 1,4-dioxane (6 mL) and H_2O (1.5 mL) were added respectively. The mixture was stirred for 1~2 h at 100 °C (oil bath) before the reaction was cooled to room temperature, diluted with EtOAc, washed with saturated aqueous NH_4Cl and dried over anhydrous Na_2SO_4 . The filtrate was concentrated in vacuo and the residue was purified by a silica gel column chromatography (PE/EtOAc = 20/1) to afford the tertiary aryl ketones **1**.

3. Asymmetric Hydrogenation of α -Substituted Tetralones

3.1 Hydrogen pressure and solvents screening

Initially, the asymmetric hydrogenation of α -phenyl tetralones (**1a**) using RuPHOX-Ru (1 mol%) was carried out under 40 bar hydrogen pressure with 'BuOK as a base in ¹AmOH at RT over 24 h (Table S1, entry 1). To our delight, the reaction provided complete conversion and excellent ee and dr values (99.1% ee and >20:1 dr). These promising results prompted us to further investigate the use of lower hydrogen pressures. It was found that reducing the hydrogen pressure from 40 bar to 2 bar showed nearly no change in either conversion or diastereoselectivity (entries 2~5). Further reducing hydrogen pressure by using a hydrogen balloon resulted in only a trace amount of product being detected (entry 6). The following asymmetric hydrogenation was therefore carried out under 2 bar hydrogen pressure to examine the effect of various solvents on the reaction. Full conversions with excellent enantio- and diastereoselectivities were obtained in alcoholic solvents such as ¹BuOH, ¹PrOH and EtOH (entries 7~9). However, when MeOH was employed in the reaction, the conversion was sharply reduced with unsatisfactory enantio- and diastereoselectivities (entry 10), mostly likely due to strong hydrogen bonding interactions. Aprotic solvent such as DCM only gave the desired product in 21% conversion, 2:1 dr and 71% ee (entry 11). No reaction was detected in the polar aprotic solvent THF (entry 12). We chose EtOH as the reaction solvent owing to it being high performing and inexpensive.

3.2 Base screening

The effect of the base on this reaction was then examined (Table S2). Organic bases, such as 'BuOK, 'BuONa, and 'BuOLi afforded full conversion and excellent enantio- and diastereoselectivities (entries 1~3). Slightly inferior results were obtained when DBU was used as a base (entry 4). Inorganic bases were also found to be suitable for the reaction. Both alkali hydroxides (KOH and NaOH) and alkali carbonates (K_2CO_3 and Na_2CO_3) gave full conversions and 94~98% ees and >20:1 drs (entries 5~8). Next, the amount of 'BuONa was investigated in the reaction (entries 9~10). It was shown that the amount of base had little effect on the reaction and almost the same catalytic behavior was obtained when the catalyst loading was reduced from 1 to 0.2 equiv. The reaction activity of the asymmetric hydrogenation was also investigated and it was found the reaction could go to completion with a very low catalyst loading (0.2 mol%, entry 11~12). When the reaction time was shortened to 2 hours, no significant effect on the activity was observed (entries 13~15). However, the reaction cannot go to completion in an hour (entry 16). Therefore, the optimal reaction conditions were chosen as the following: using 0.2 mol% RuPHOX-Ru as the catalyst and 0.2 equiv 'BuONa as the base in EtOH under 2 bar H₂ pressure at room temperature for 2 h.

3.3 Control experiment

In order to further confirm whether or not transfer hydrogenation occurs in the reaction, we conducted the asymmetric hydrogenation of **1a** under the optimal reaction conditions in the absence of H₂ (Table S3). It was found that almost no transfer hydrogenation occurred within 8 h, and only 12% conversion has been obtained even after 48 h; the hydrogenated product **2a** was obtained with very poor stereoselectivity. The results indicated that asymmetric transfer hydrogenation is negligible during the reaction and H₂ is the hydrogen source for efficient asymmetric hydrogenation.

3.4 Substrate scope

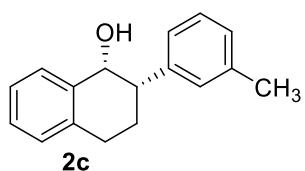

General Procedure: The substrate **1a** (0.3 mmol), (*S,Sp*)-RuPHOX-Ru (1.04 mg, 0.2 mol%) and *t*BuONa (0.2 equiv) were placed in a 5.0 mL tube equipped with a magnetic stirrer bar, which was then put into an autoclave. The pre-prepared solution of catalyst was added under a nitrogen atmosphere. After purging with hydrogen three times, the hydrogen pressure was finally pressurized to 2 bar. The reaction mixture was vigorously stirred at room temperature for 2 h. The conversion of the product and dr value were determined by ¹H NMR spectroscopic analysis of the crude reaction mixture and the yield was calculated after isolation by flash chromatography (PE/EtOAc = 10/1). The ee value was determined by chiral HPLC using Chiral column IA, IB-3, IE, OJ-H, OD-H, AD-H or OX columns with *n*-hexane/*i*-PrOH as eluent.

4. Scale-up Synthesis and Transformations

4.1 Scale-up synthesis of 2a

The substrate **1a** (1.24 g, 5.6 mmol), (*S,Sp*)-RuPHOX-Ru (1.04 mg, 0.02% mmol) and 'BuONa (1.24 g, 2.8 mmol) were placed in a 50 mL flame-dried round bottom flask equipped with a magnetic stir bar. The mixture was dissolved in anhydrous and degassed EtOH (20 mL) in a glove box. This flask was put into an autoclave. After purging with hydrogen three times, the hydrogen pressure was finally pressurized to 20 bar. The reaction mixture was vigorously stirred at room temperature for 48 h. The reaction mixture was concentrated and purified via silica gel column chromatography (PE/EtOAc = 10/1) to provide **2a** (1.17 g, 94%, 99.1% ee, >20:1 dr). [α]_D²⁵ = +162.00 (*c* 0.30, CH₂Cl₂). A hydrogenation tube was charged with a stirring bar, **2a** (0.22 mmol), Pd/C (20% mmol) and TfOH (0.2 equiv). MeOH (2 mL) was then injected into the hydrogenation tube by a syringe. The hydrogenation tube was then put into an autoclave. The autoclave was then charged with hydrogen to 30 bar hydrogen pressure, and the reaction mixture was stirred at RT for 12 h. The solvent was evaporated to afford the crude product and it was purified by a silica gel column chromatography (PE: EtOAc = 10:1) to give pure product **3** as colorless oil (47 mg, 99%).^[19] ¹H NMR (400 MHz,

4.6 Synthesis of (*1R,2S*)-1-allyl-2-phenyl-1,2,3,4-tetrahydronaphthalen-1-ol (**7**)

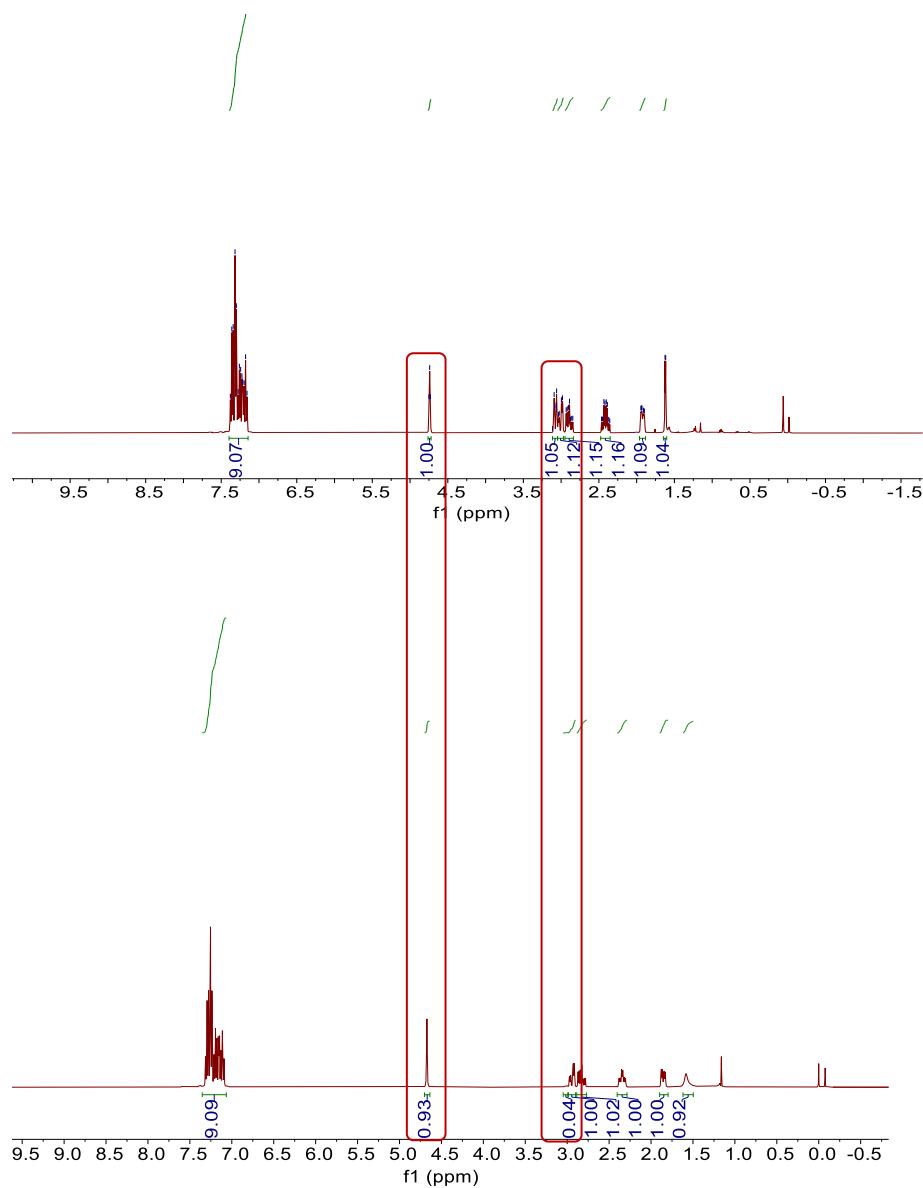

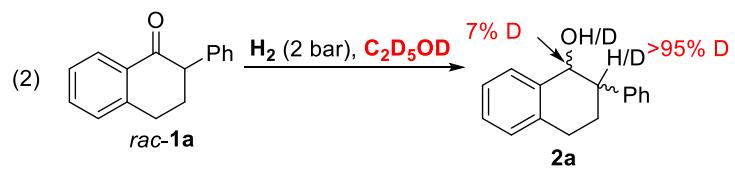

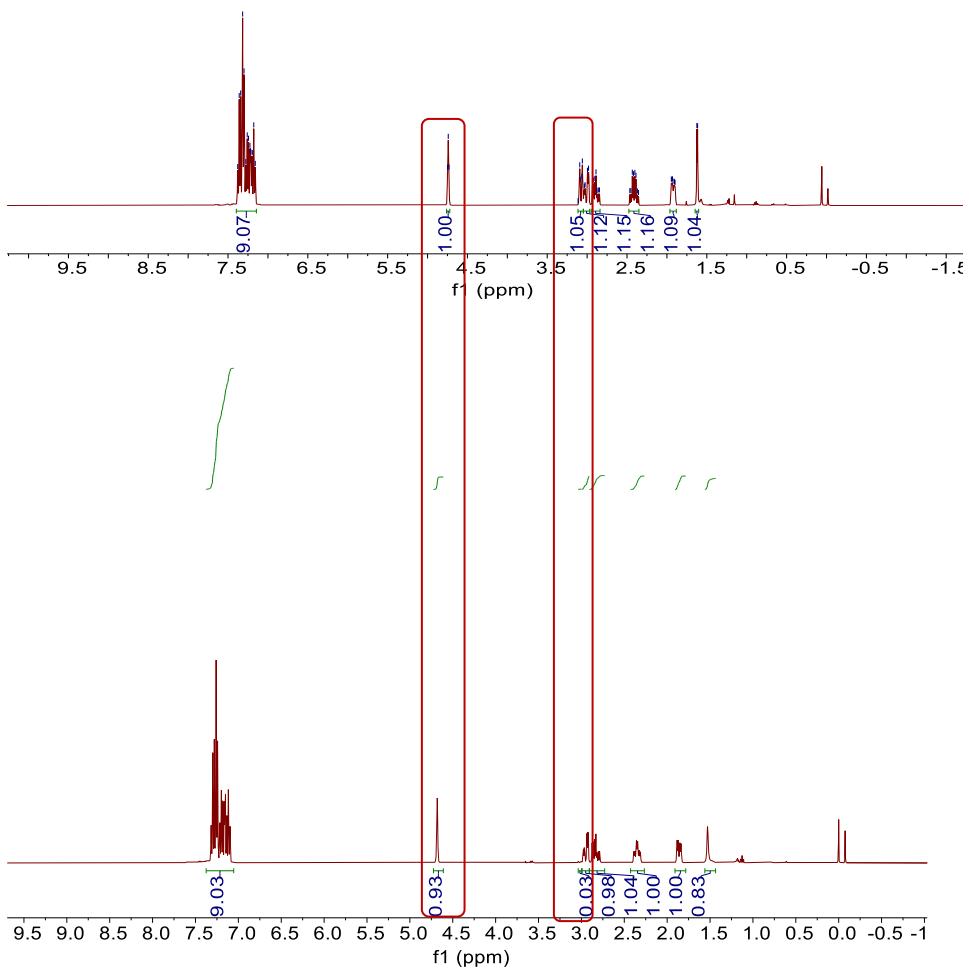

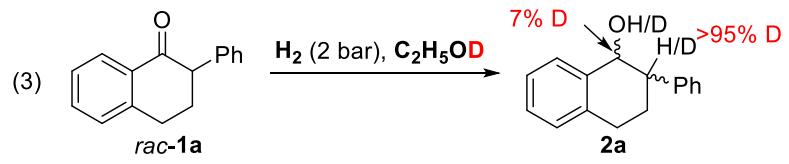

To a 10 mL Shrek tube were added **2a** (0.4 mmol) and THF (2 mL). Then C₃H₅MgBr (0.48 mmol) was added dropwise at -20 °C. After 10 hours, the reaction mixture was diluted with CH₂Cl₂ (5 mL) and then purified via silica gel column chromatography (PE/EtOAc = 10/1) to afford pure **7** as a colorless oil (75 mg, 77%). ¹H NMR (400 MHz, CDCl₃) major diastereomer: δ 7.48 (dd, *J* = 7.6, 1.7 Hz, 1H), 7.28–7.06 (m, 8H), 7.02 (dd, *J* = 7.3, 1.8 Hz, 1H), 5.47–5.36 (m, 1H), 5.03–4.90 (m, 2H), 3.08 (dd, *J* = 10.8, 3.2 Hz, 1H), 2.79–2.70 (m, 2H), 2.37 (dd, *J* = 14.4, 8.1 Hz, 1H), 2.15–2.05 (m, 1H), 1.89–1.86 (m, 1H), 1.72 (s, 1H). ¹³C NMR (100 MHz, CDCl₃) δ 141.8, 140.4, 137.4, 134.6, 129.8, 129.0, 128.4, 127.5, 127.4, 126.9, 126.6, 118.3, 73.6, 48.2, 45.5, 29.6, 26.1. minor diastereomer δ 141.8, 141.2, 135.9, 134.2, 129.7, 128.7, 128.1, 127.4, 125.7, 118.2, 74.5, 51.9, 43.2, 29.2, 25.5.
