1. General Methods

All chemicals were obtained from commercial sources and used without further purification unless otherwise stated. Needles were obtained from Terumo®, Agani™ needle (VWR). All air sensitive reactions were performed under the nitrogen atmosphere using Schlenk technique. Solvents were dried using solvent purification system (PS-MD-5/7 Inert technology). Reactions were followed by thin-layer chromatography (TLC) using silica gel coated aluminum plates (silica gel 60 F250, Sigma-Aldrich and VWR). TLC plates were visualized by UV light (254 nm) or by staining with KMnO₄ or p-Anisaldehyde solution. Flash column chromatography was performed on silica gel (40 – 63 µm, VWR) or with Büchi Revelelis® X2 system using Büchi FlashPure EcoFlex silica gel 50 µm cartridges. GC-MS was performed on Agilent 19091S-433 gas chromatograph coupled to Agilent 5977E MSD detector. Separations were performed on HP-5MS Phenyl Methyl Silox of 30 m x 250 µm x 0.25 µm column. HR-MS was performed on Water XEVO-G2 QTOF mass spectrometer using ESI or APCI ionization source. NMR spectra were recorded on Varian NMR 400 spectrorometer (or Bruker Avance III HD 700 MHz and 800 MHz spectrometer – NMR center). Chemical shifts (δ) are reported in ppm relative to the residual solvent peak. Splitting patterns are indicated as (s) singlet, (d) doublet, (dd) doublet of doublets, (ddd) doublet of doublet of doublets, (dddd) doublet of doublet of doublet of doublets, (t) triplet, (tt) triplet of triplets, (dt) doublet of triplets, (td) triplet of doublets, (ddt) doublet of doublet of triplets, (q) quartet, (dq) doublet of quartets, (p) pentet, (m) multiplet. Coupling constants (J) are reported in Hertz (Hz). Photoredox reactions were performed in EvoluChem™ PhotoRedOx Box by HepatoChem using EvoluChem LED 18 W (P201-18-2, 450 – 455 nm). Enantiomeric excess was determined by chiral HPLC using Chiralpak® AD-H column with hexane/i-PrOH as the eluent. ICP-MS was performed using Thermo Scientific ICAP-Q ICP-MS equipped with ESI FAST sample introduction system, operated in KED mode with helium as collision gas.

2. Preparation and characterization of N-alkoxythiazolethione precursors

Corresponding tosylates 1aa – 1jj were prepared according to general method A. Tosylates 1gg, 1kk, 1mm were used as a crude material without the purification. Corresponding mesylates 1ll, 1nn – 1rr were prepared following the literature procedure and used as a crude material without the purification.

2.1 General method A for the synthesis of tosylates 1aa – 1jj

Corresponding alcohol (1 eq) was dissolved in CH₂Cl₂ (1 ml/mmol) and the solution was cooled to 0 °C. Pyridine (2 eq) was added dropwise and the solution was let to stir for 10 min. TosCl (1.5 eq) was added portionwise into the solution. After the addition, the reaction mixture was let to warm up and stir at room temperature. After the full conversion of alcohol, the reaction mixture was diluted with Et₂O and organic solution was washed with water. N,N-dimethylmethylenediamine (DMEN, 1 eq in respect to TosCl) was added into the organic solution and the solution was thoroughly washed with water, Brine, dried over Na₂SO₄ and concentrated under the reduced pressure. Final product was purified by flash column chromatography unless otherwise stated.
4-phenylbutyl 4-methylbenzenesulfonate (1aa)

3. Preparation and characterization of N-alkoxythiazolethiones

3.1 General method B for the synthesis of N-alkoxythiazolethiones 1a – 1r

Cyclic thiohydroxamic acid (Thi)\(^3\) (1.3 eq) was dissolved in CH\(_3\)CN (0.4 ml/mmol). K\(_2\)CO\(_3\) (4.8 eq) and NBu\(_4\)HSO\(_4\) (13 mol \%) were added to the solution and resulting slurry was let to stir for 30 min. The corresponding sulfone (1 eq) was added, and the reaction was let to stir at room temperature for 24 – 48 h. Resulting viscous reaction mixture was diluted with water (30 ml) and extracted with CH\(_2\)Cl\(_2\) (4 x 25 ml). Combined organic extracts were washed with 2 M NaOH, Brine, dried over Na\(_2\)SO\(_4\) and concentrated under the reduced pressure. Final N-alkoxythiazolethione was purified by flash column chromatography.

**4. Photoredox catalytic studies**

Photoredox reactions were performed in EvoluChem™ PhotoRedOx Box by HepatoChem using EvoluChem LED 18 W (P201-18-2, 450 – 455 nm). Fans were removed from the set-up, and the reaction temperature 55°C was reached with the heat produced by the lamp (see below). Reactions that followed General photoredox method D were performed under the continuous positive pressure of N₂ delivered into the capped vial via a metallic needle, where the needle (4.5 cm) was fully inserted into the headspace of the vial (vial: 8 cm, headspace: 6.5 cm).
### 4.1 Photoredox optimization studies

![Scheme 1](image)

**Table S1.** a) reaction time 15 h, reaction temperature 25 °C, b) reaction time 6 h, reaction temperature 55 °C, c) reaction performed with a metallic needle inserted into the system, d) reaction performed in the dark, e) yields were determined by \(^1\)H NMR using ethylene carbonate as an internal standard.
4.2 NMR study of \(N\)-alkoxythiazolethione 1a transformation

The transformation of 1a was followed in time. The reaction was prepared and performed according to General photoredox method D. Results are summarized below.

**Figure S1** Reaction conditions: 1a (0.1 mmol), Ru(bpy)\(_3\)(PF\(_6\))\(_2\) (5 mol%), CBrCl\(_3\) (10 eq), in CH\(_3\)CN (0.05 M), blue LED irradiation at 55 °C, needle inserted into the vial. Yields of 2a (blue) and 3a (orange) were determined by \(^1\)H NMR using ethylene carbonate as an internal standard.

As shown in Figure S1, tetrahydrofuran 2a is formed prior to ketone 3a, and the concentration of 2a starts decreasing simultaneously with increasing concentration of 3a.
Figure S2 Reaction conditions: 1a (0.1 mmol), Ru(bpy)$_3$(PF$_6$)$_2$ (5 mol%), CBrCl$_3$ (10 eq), in CH$_3$CN (0.05 M), blue LED irradiation at 55 °C, needle inserted into the vial. 2a (4.75 ppm, 4.01 – 3.90, ppm, 3.85 – 3.75 ppm), 3a (3.46 ppm, 3.05 ppm).
4.3 Screening of different metal sources

Since it was observed that the presence of a metallic needle in the system significantly improves the formation of bromoketone 3a, the exact metal composition of the needle was identified. Elemental analysis has shown iron, chromium, and nickel (633 218 µg/g, 152 918 µg/g, 73 844 µg/g respectively) to be major metals present in the needle used in our experiments.

ICP-MS analysis of crude reaction mixture proved the presence of the above-mentioned metals (0.4896 mg/l, 0.1945 mg/l, 0.0887 mg/l respectively, reaction prepared and performed according to General photoredox method D).

Additionally, in replacement for the needle, different sources of iron, chromium, and nickel were tested under our optimized conditions. Reactions were prepared according to General photoredox method C. Reactions were performed with 1H-alkoxypyrazolethione 1a, and a corresponding metal source (0.02 mmol, 0.2 eq) was added. Results are summarized below.

![Diagram](image)

**Figure S3** Reaction conditions: 1a (0.1 mmol), Ru(bpy)$_3$(PF$_6$)$_2$ (5 mol%), CBrCl$_3$ (10 eq), TBAB (1.1 eq), metal (0.2 eq) in CH$_3$CN (0.05 M), blue LED irradiation at 55 °C, 6h. Yields of 2a (blue) and 3a (orange) were determined by 1H NMR using ethylene carbonate as an internal standard.
5. Preparation and characterization of photoredox products

5.1 General photoredox method C for the synthesis of cyclic ethers 2a – 2r

An oven-dried Biotage MW vial was charged with corresponding N-alkoxythiazolethione 1 (0.1 mmol), Ru(bpy)$_3$(PF$_6$)$_2$ (4.3 mg, 5 mol%) and TBAB (35.5 mg, 1.1 eq). The vial was capped, and the headspace of the vial was exchanged for the nitrogen by three vacuum/N$_2$ cycles. CBrCl$_3$ (98.7 µl, 10 eq) and anhydrous CH$_3$CN (2 ml, 0.05 M) were added. Both CBrCl$_3$ and CH$_3$CN were deoxygenated by sparging with argon for 20 min prior to the addition. The resulting reaction mixture was placed into the photoreactor and irradiated with blue light for 6 h at 55 °C. Crude reaction mixture was absorbed on Celite and purified by flush column chromatography.

5.2 General photoredox method D for the synthesis of bromoketones 3a – 3r

An oven-dried Biotage MW vial was charged with corresponding N-alkoxythiazolethione 1 (0.1 mmol), Ru(bpy)$_3$(PF$_6$)$_2$ (4.3 mg, 5 mol%) and TBAB (35.5 mg, 1.1 eq). The vial was capped, and the headspace of the vial was exchanged for the nitrogen by three vacuum/N$_2$ cycles. CBrCl$_3$ (98.7 µl, 10 eq) and anhydrous CH$_3$CN (2 ml, 0.05 M) were added. Both CBrCl$_3$ and CH$_3$CN were deoxygenated by sparging with argon for 20 min prior to the addition. The resulting reaction mixture was placed into the photoreactor and irradiated with blue light for 6 h at 55 °C. Reaction was performed under the continuous positive pressure of N$_2$ delivered into the vial via a metallic needle. Crude reaction mixture was absorbed on Celite and purified by flush column chromatography.

NH\(_4\)OHCl (0.3 mmol, 21.15 mg, 1.5 eq) and KH\(_2\)PO\(_4\) (0.3 mmol, 40.8 mg, 1.5 eq) was added and resulting mixture was heated to 70 °C for 2 h. Reaction mixture was diluted with Na\(_2\)CO\(_3\) (10 ml) and extracted with EtOAc (3x10 ml), dried over Na\(_2\)SO\(_4\), and concentrated under reduced pressure. Final product 7 was recrystallized from diisopropyl ether and isolated as white solids in 99% yield (0.19 mmol, 31 mg). \(\text{\textsuperscript{1}H NMR (400 MHz, CDCl}_3\text{)} \delta 8.36 - 8.28 (m, 2H), 7.47 - 7.37 (m, 3H), 4.22 (tt, } J = 7.9, 1.9 \text{ Hz, 2H), 3.17 (ddt, } J = 8.3, 6.6, 1.9 \text{ Hz, 2H), 2.26 - 2.13 (m, 2H). \text{\textsuperscript{13}C NMR (101 MHz, CDCl}_3\text{)} \delta 140.5, 130.3, 129.3, 128.5, 127.3, 65.1, 31.0, 16.7. \text{GC-MS(EI) (m/z): exact mass calculated for C\(_{10}\)H\(_9\)NO + [M\(^+\)] 161.0841, found 161.1.\)
