60 Materials and methods

61 Chemicals and materials. All other commercial chemicals were purchased from Sigma-Aldrich (Stockholm, Sweden), Aladdin
62 (Beijing, China) or Macklin (Shanghai, China). All PCR reagents and enzymes were purchased from TaKaRa Biotechnology
63 Co. (Dalian, China). Primers were synthesized by Talen-bio Biological Technology Co. (Shanghai, China).

Homology modeling and structure analysis. Homology modeling of *Ra*BVMO was performed using AlphaFold2 software ¹
(<u>https://alphafold.ebi.ac.uk/</u>). The structure of *Ra*BVMO was evaluated by SAVES v6.0 ² (<u>https://saves.mbi.ucla.edu</u>). CAVER
3.0 ³ (<u>http://www.caver.cz</u>) was used to identify the tunnels existing in *Ra*BVMO. The *Ra*BVMO mutants were generated using
Chimera (version 1.16). Molecular docking analysis was performed by Discovery studio 4.5 and the docking results were selected
according to their binding affinities and molecule conformations.

69 Library construction. Variants were generated using whole-plasmid mutagenesis protocol with the plasmid of the WT and 70 corresponding mutants as a template. Saturation mutagenesis was then performed on selected sites using the NNK codon. Sites 71 exhibiting over 50% activity or 25% ee were subjected to further iterative combinatorial mutagenesis (ISM). The primers used 72 in the library creation process are listed in the Supporting Information (Table S1). The PCR procedures were as follows: 95 °C 73 for 2 min, followed by 25 cycles of 94 °C for 30 s, 50 °C for 30 s, and 68 °C for 3 min and 40 s. After Dpn I digestion at 37 °C 74 for 1h, the PCR products were transformed into competent E. coli BL21 (DE3) cells and plated onto LB agar plates supplemented 75 with 50 μ g/mL kanamycin. The cells were spread on the LB-agar plates supplemented with 50 μ g·mL⁻¹ kanamycin for overnight 76 incubation at 37 °C.

77 Library screening. Colonies were randomly picked and introduced into 96-well plates that containing 300 µL of LB medium 78 (10 g·L⁻¹ NaCl, 10 g·L⁻¹ tryptone, 5 g·L⁻¹ yeast extract) with 50 μ g·mL⁻¹ kanamycin. After overnight growth at 37 °C, with 79 shaking at 180 rpm, 100 µL overnight cultures were inoculated into 4 mL of fresh LB medium containing 50 µg·mL⁻¹ kanamycin 80 in a new 24 deep-well plate. For protein expression, IPTG was added to a final concentration of 0.2 mM after cultivation at 25°C 81 for 16 h. Then the cultures were centrifuged at 4000 rpm and at 4 °C for 15 min to collect cells. Subsequently discarding the 82 supernatants, the cells were lysed with 500 µL lysis buffer (pH 9.0 Tris-HCl buffer, 750 mg·mL⁻¹ lysozyme) at 4 °C for 4 h and 83 then centrifuged at 4 °C and 4000 rpm for 15 min. 400 µL of each supernatant were transferred into a new 24 deep well plate to prepare the reaction mixture. In each well of the plate, 500 µL of reaction mixture was added, containing 1 mM NADPH, and 1 84 85 mM substrate with 5% (v/v) methyl alcohol. The reaction plates were incubated at 30 °C with shaking at 180 rpm for 4 h. After 86 500 µL of acetonitrile was added into each well, the reaction plates were centrifuged at 4 °C and 4000 rpm for 30 min. Then 200 87 µL of the supernatants in each well were subjected to HPLC analysis. The mutants with improved selectivity or activity were 88 picked out, and the results were confirmed by repeating the reaction in Eppendorf tubes. The mutations in the gene of the mutants 89 were confirmed by sequencing.

90 Enzyme expression and purification. The single colonies of RaBVMO WT and mutants were inoculated into 4 mL of LB 91 media supplemented with 50 µg·mL⁻¹ kanamycin. After overnight growth at 37 °C, 1 mL of culture were transferred into 100 92 mL of LB media containing 50 μ g·mL⁻¹ kanamycin as an inducer at 25 °C with shaking at 180 rpm for 16 h for enzyme 93 expression. Cell pellets were harvested by centrifugation and washed once with 100 mM, pH 9.0 Tris-HCl buffer. The pellets 94 were suspended in 10 mL of 100 mM Tris-HCl buffer (pH 9.0) and were disrupted by sonication. The supernatant containing the crude enzyme was obtained by centrifugation at 4 °C and 8000 rpm for 30 min. After going through the filter, the supernatant 95 96 was subjected to affinity chromatography (HisTrapTM FF column, 5 mL) for purification. The impurity was removed by flushing 97 the column with 50 mM imizadol, and the enzyme was eluted by 25 mM Tris-HCl buffer containing 250 mM imizadol and 0.5 98 M NaCl. The elution fractions were subjected to a desalination column for removal of salt and imizadol. The purified enzymes 99 were dissolved in 100 mM, pH 9.0 Tris-HCl buffer and stored at -80 °C for use. The purity of the enzyme was confirmed by 100 SDS-PAGE (Fig S6 in Supporting Information). The concentration of the purified enzyme was determined by a Bradford protein 101 assay method, following the provided protocol.

102 Specific activity and enantioselectivity assays. The specific activity and stereoselectivity of *Ra*BVMO variants toward 103 cyclohexanone (1a), thioanisole (1b), methyl(naphthalen-2-yl)sulfane (1c), benzyl(phenyl)sulfane (1d) and omeprazole sulfide 104 (1e) were measured using purified enzymes. In a 500 μL reaction system, 2 mM substrate 1a or 1b (1 mM for 1c or 1e), 2 mM 105 NADPH for 1a or 1b (1 mM NADPH for 1c or 1e), and diluted enzyme were mixed in Tris-HCl (100 mM, pH 9.0). After the 106 reaction was performed at 30 °C for 30 min, the reaction mixture was extracted with an equal volume of ethyl acetate. The

specific activity and enantioselectivity were determined by GC or HPLC, as described elsewhere^{4, 5}. All the measurements were
 carried out in triplicate.

109 Determination of kinetic parameters. The kinetic constants (*K*m and *k*cat) of MT2 were assayed by varying the concentration 110 of omeprazole sulfide (1e) from 0.01 to 1 mM with 1 mM NADPH present in each reaction. The reaction time was 30 min at 30 111 °C and the conversion rate relative to substrate was maintained within 20%. The kinetic parameters were calculated according 112 to non-linear curve fitting with Michaelis–Menten equation. All samples were determined by HPLC and all experiments were 113 carried out in triplicate.

Asymmetric oxidation of omeprazole sulfide for synthesis of *S*-omeprazole. A 10 mL of reaction mixture was composed of 0.35-, 0.6- or 1-g/L omeprazole sulfide (1e) as substrate (with 5% (v/v) MeOH), glucose (1.5 equiv), purified enzyme M2T (4 g/L), glucose dehydrogenase (GDH, 10 g/L), NADP⁺ (0.2 mM), and Tris-HCl buffer (100 mM, pH 9.0) and was shaken at 180 rpm and 30 °C. Samples were intermittently removed and extracted to analyze the conversion rate by HPLC.

118 Molecular simulations. Molecular docking analysis was performed by Discovery studio 4.5. The model structure of *Ra*BVMO containing FAD and NADP was used. The receptor model was built using the Protein Preparation Wizard ⁶. Protonation states were determined using PROPKA ^{7, 8}. Prior to docking, each protein structure was energy minimized using the OPLS2005 force 121 field ⁹, with all heavy atoms restrained to an RMSD of 0.3 Å.

141 Fig. S1 Procheck-Ramachandran plots and 3D-profile window plots of the Verify 3D server for the strucure model of *Ra*BVMO
142 by homology modelling and the corresponding Ramachandran plot statistics. A: Three-dimensional structure of *Ra*BVMO; B
143 and C: Ramachandran plots for structural model of *Ra*BVMO; D: 3D-profile window plots for the homology model of *Ra*BVMO.

144

The Ramachandran plot distribution indicated that structure of RaBVMO had over 90% of residues in the most favored orientation. In the structure of RaBVMO the only residue (Ser³⁹³) in disallowed region was later shown to be away from the catalytic cavity. Therefore, we could conclude that the structural model agreed well with the expected conformational space for residues. In addition, the 3D-1D averaged profile analysis of the Verify 3D server showed a reliable folding in most regions of the structure of RaBVMO (99.28% of the residues had an averaged 3D-1D score >= 0.2). In summary, the overall assessment indicated that model of RaBVMO had a satisfactory accuracy for further structure-based analysis.

151

152

Fig. S2 Conservation analysis of seven key sites (67, 68, 337, 338, 442, 443 and 444) of *Ra*BVMO. The residue frequencies were constructed with WebLogo.

176 Fig. S6 SDS-PAGE (10%) analysis of the purified wild-type of *Ra*BVMO and varients. M, molecular weight marker; lane 1,
177 wild-type *Ra*BVMO; lane 2, mutant F442A; lane 3, mutant F442A/R337P.

The wild-type of *Ra*BVMO and variants were overexpressed in *E. coli* BL21(DE3) using pET28a as expression vector. The recombinant wild-type of *Ra*BVMO and varients with an N-terminal His-tag was purified to electrophoretic homogeneity by nickel affinity chromatography. The purified enzyme migrated as a single band with a molecular weight of approximately 61 kDa on SDS-PAGE (**Fig. S6**), consistent with the theoretical molecular mass of the His-tagged protein.

Fig. S7 Time course of sulfoxidation of omeprazole sulfide catalyzed by mutant MT2. A 10 mL of reaction mixture
was composed of 0.35-, 0.6- or 1-g/L omeprazole sulfide (1e) as substrate (with 5% (v/v) MeOH), glucose (1.5 equiv),
purified enzyme M2T (4 g/L), glucose dehydrogenase (GDH, 10 g/L), NADP⁺ (0.2 mM), and Tris-HCl buffer (100
mM, pH 9.0) and was shaken at 180 rpm and 30 °C for 8 h. Conversion and enantiomeric excess were determined by
HPLC.
