## S1. Materials and Methods.

**S1.1. Materials.** Chloroauric acid ( $\text{HAuCl}_4 \cdot x\text{H}_2\text{O}$ ), potassium tetrabromidoaurate ( $\text{KAuCl}_4$ ) and pyridine derivatives were acquired from commercial suppliers (Sigma-Aldrich, TCI America) and used without further purification.

### S1.2. Characterization of the compounds.

FT-IR spectra were obtained using a Nicolet Nexus FT-IR spectrometer equipped with UATR unit.

*Synthesis of  $\text{AuCl}_3 \cdot \text{cotinine}$  (**1a**)*. A solution of chloroauric acid (0.02 mmol) in methanol (2 mL) was dropped in a clear borosilicate vial containing an equimolar amount of cotinine in the same solvent (3 mL). Yellow crystals of **1a** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained in 24 hours by slow evaporation of the solvent. FT-IR (selected bands,  $\text{cm}^{-1}$ ) 3044, 1672, 1447, 1395, 1253, 1192, 1152, 1110, 918, 814, 689. Elemental Analysis for:  $\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}\text{AuCl}_3$ , % calc. (found): C, 25.05 (25.10); H, 2.52 (2.53); Cl, 22.18 (22.12); N, 5.84 (5.84).

*Synthesis of  $\text{AuCl}_3 \cdot 3\text{-fluoropyridine}$  (**1b**)*. Yellow crystals of **1b** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained by using a procedure similar to that used for **1a**. FT-IR (selected bands,  $\text{cm}^{-1}$ ) 1551, 1471, 1442, 1347, 1307, 1281, 1241, 1177, 1101, 1035. Elemental Analysis for  $\text{C}_5\text{H}_4\text{NFAuCl}_3$ , % calc. (found): C, 15.00 (14.97); H, 1.01 (1.02); N, 3.50 (3.52).

*Synthesis of  $\text{AuCl}_3 \cdot 3\text{-chloro pyridine}$  (**1c**)*. Yellow crystals of **1c** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained by using a procedure similar to that used for **1a**. FT-IR (selected bands,  $\text{cm}^{-1}$ ) 1594, 1558, 1469, 1427, 1321, 1247, 1195, 1129, 1122, 1089, 1068, 1029. Elemental Analysis for  $\text{C}_5\text{H}_4\text{NAuCl}_4$ , % calc. (found): C, 14.41 (14.37); H, 0.97 (0.96); Cl, 34.02 (34.12); N, 3.36 (3.31).

*Synthesis of  $\text{AuCl}_3 \cdot 3\text{-bromo pyridine}$  (**1d**)*. Yellow crystals of **1d** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained by using a procedure similar to that used for **1a**. FT-IR (selected bands,  $\text{cm}^{-1}$ ) 1635, 1560, 1467, 1423, 1403, 1240, 1198, 1122, 1109, 1064. Elemental Analysis for  $\text{C}_5\text{H}_4\text{NBrAuCl}_3$ , % calc. (found): C, 13.02 (13.03); H, 0.87 (0.86); N, 3.04 (3.04).

*Synthesis of AuCl<sub>3</sub>·3-iodo pyridine (**1e**)*. Yellow crystals of **1e** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained by using a procedure similar to that used for **1a**. FT-IR (selected bands, cm<sup>-1</sup>) 1588, 1549, 1473, 1463, 1425, 1415, 1329, 1239, 1195, 1117, 1102, 1084, 1062, 1025. Elemental Analysis for C<sub>5</sub>H<sub>4</sub>NIAuCl<sub>3</sub>, % calc. (found): C, 11.81 (11.82); H, 0.79 (0.78); N, 2.76 (2.76).

*Synthesis of AuBr<sub>3</sub>·cotinine (**1f**)*. A solution of KAuBr<sub>4</sub> (0.02 mmol) in methanol (2 mL) was dropped in a clear borosilicate vial containing an equimolar amount of cotinine in the same solvent (3 mL). The solution was then heated at 50 °C for 12 hours. Orange crystals of **1f** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained in 24 hours by slow evaporation of the solvent. FT-IR (selected bands, cm<sup>-1</sup>) 1675, 1447, 1394, 1308, 1252, 1192, 1153, 1109, 916, 816, 691. Elemental Analysis for: C<sub>10</sub>H<sub>12</sub>N<sub>2</sub>OAuBr<sub>3</sub>, % calc. (found): C, 19.06 (19.02); H, 1.97 (1.95); Br, 39.11 (39.16); N, 4.57 (4.58).

*Synthesis of AuBr<sub>3</sub>·3-fluoro pyridine (**1g**)*. Orange crystals of **1g** with an elongated block shape and suitable for single crystal X-Ray diffraction were obtained by using a procedure similar to that used for **1f**. FT-IR (selected bands, cm<sup>-1</sup>) 1610, 1579, 1479, 1441, 1417, 1260, 1249, 1186, 1117, 1098, 1049, 1026. Elemental Analysis for C<sub>5</sub>H<sub>4</sub>NFAuBr<sub>3</sub>, % calc. (found): C, 11.25 (11.24); H, 0.76 (0.78); N, 2.62 (2.61).

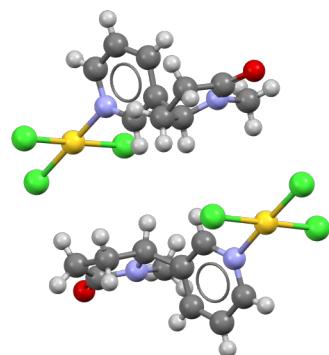

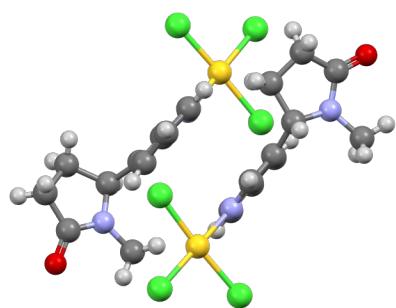

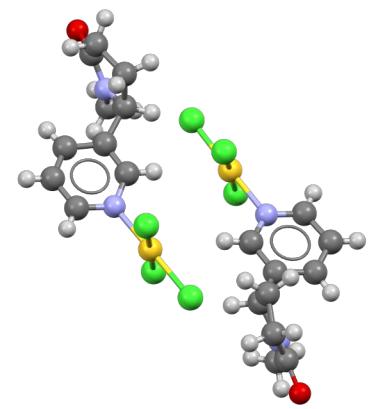

## S2. Crystallographic Details.

**S.2.1. General Remarks.** The single crystal data of the compounds were collected at room temperature using a Bruker SMART APEX II CCD area detector diffractometer. Data collection, unit cell refinement and data reduction were performed using Bruker SAINT. Structures were solved by direct methods using SHELXT<sup>1</sup> and refined by full-matrix least-squares on F<sup>2</sup> with anisotropic displacement parameters for the non-H atoms using SHELXL-2016/6<sup>2</sup>. Absorption correction was performed based on multi-scan procedure using SADABS. Structure analysis was aided by use of the programs PLATON<sup>3</sup>. The hydrogen atoms were calculated in ideal positions with isotropic displacement parameters set to 1.2xU<sub>eq</sub> of the attached atom. In compound **1a**, the reported low fraction of measured data is due to the bad quality of the needle-shaped crystal selected for the data collection. Many crystals of the same sample have been tested, and the best one was selected. In compound **1b**, high residual peaks of electron density have been found around the gold atom. As in all the samples of this work, empirical methods for absorption correction have been applied, trying to find the best compromise between data quality and data completeness. In order to minimize/avoid these residual peaks around the metal, analytical methods for absorption correction would be needed, although the quality of these crystals, makes it unfeasible. We tested many crystals of **1b** and we collected the best one.

### S.2.2. Crystallographic details and Figures for compounds 1a-1g.

**Table S.1** Crystal data and structure refinement for **1a**.

### S3. CSD Surveys.

**Table S.8** Number of hits on the CSD displaying tetravalent gold compounds bound to three halogens and a pyridyl substituent. In red, hits displaying a contact between the gold atom and a nucleophile (N, P, O, S, Se, F, Cl, Br, I considered) shorter than the sum of the respective van der Waals radii of involved atoms and establishing X/N-Au···Nu angles spanning the range 80 and 100°. In blue, hits displaying two of such contacts on the same gold atom. For this analysis, according to Batsanov's suggestion<sup>4</sup>, the crystallographic vdW radius of gold was set to 210 pm.

## S4. Computational Details.

**S.4.1. Theoretical methods.** The energetic features of the adducts analyzed in this work were calculated at the PBE0<sup>5</sup>-D3<sup>6</sup>/def2-TZVP<sup>7</sup> level of theory using the crystallographic coordinates for the X-ray adducts. For gold, the inner shell electrons are modelled by ECPs (ECP-60 scheme),<sup>8</sup> which also accounts for scalar relativistic effects. The GAUSSIAN-16 program has been used for the energetic calculations<sup>9</sup> and NBO7 program for NBO analysis.<sup>10</sup> The basis set superposition error for the calculation of interaction energies has been corrected using the counterpoise method.<sup>11</sup> Molecular electrostatic potential (MEP) surfaces have been computed at the same level of theory and represented using several isovalue of electron density to map the electrostatic potential. The QTAIM<sup>12</sup> and NCIPlot<sup>13,14</sup> analyses has been performed using the AIMAll program<sup>15</sup> at the same level of theory.

### S.4.2. QTAIM/NCIPlot analysis of compounds **1b-e** and **1g**

Figure S.8. shows the QTAIM/NCIplot analyses and dimerization energies of selected CiB assemblies of compounds **1b-e** and **1g**. The interaction energies range from -9.1 to -18.8 kcal/mol, depending on the number of CiBs, HBs and the electron donors. The interaction energies in the antiparallel dimers where X = Cl (**1d** and **1e**) are larger than those of parallel X = Br (**1g** and **1c**). The binding energy of the dimer **1b**, where only one CiB is formed, is approximately half of that of **1d** and **1e** (two CiBs I antiparallel orientation).

In all cases the CiB interactions are characterized by the corresponding bond CPs, bond paths and blue isosurfaces connecting the Au to the X-atoms. In case of the parallel orientation, additional π-stacking interactions are formed.

**Figure S.8.** QTAIM distribution of the critical points of the intermolecular bond and ring (red and yellow spheres, respectively) and bond paths for the dimeric assemblies of compounds **1b** (a), **1g** (b), **1c** (c), **1d** (d) and **1e** (e). The superimposed NCIplot isosurface (RDG isovalue=0.4 a.u.) is shown. The cut-off  $\rho=0.04$  a.u. has been used. Color range:  $-0.025$  a.u.  $\leq (\text{sign}\lambda_2)\rho \leq 0.025$  a.u. Level of theory: PBE0-D3/def2-TZVP.
