

CrystEngComm

Supporting Information

Crystallographic studies towards solid state behavior of *syn*- and *anti*- conformers of terphenyl based perfluorinated halogen bond donors.

Julian Stoesser^a, Elric Engelage^a and Stefan M. Huber^{*a}

A.) General Information	3
B.) Crystal data.....	14
C.) References.....	68

A.) General Information

A.1.) Experimental setup for crystal growth

Single crystals of all the halogen bond donors were obtained by dissolving 5 mg of each one in pentane and letting the solvent slowly evaporate.

Co-crystallization experiments were set up as follows:

A 34,4 mM stock solution of the designated halogen bond donors and halide salts were set up in DCM. After that 0.1 mL of the Host and 0.1 mL of the guest solutions were transferred into a GC-vial and the solvent was slowly evaporated leading to crystal formation.

A.2.) Crystal structure determination

Crystal structure determination was carried out on a *Rigaku* XtaLAB mini, equipped with a 600 W Mo micro-fine focus glass sealed tube, graphite monochromator (Mo K_{α}) and Mercury375R CCD detector or a *Rigaku* Synergy dual source device, with Cu and Mo micro focus sealed tubes (Cu & Mo K_{α}) using mirror monochromators and a HyPix-6000HE: Hybrid photon counting X-ray detector, Rigaku Supernova with a Cu micro focus sealed tubes, mirror monochromator and an Atlas detector, and an Agilent XCalibur with a Mo fine focus glass sealed tube, graphite monochromator, and Sapphire2 detector. Crystals were mounted in *Hampton* CryoLoops using *GE/Bayer* silicone grease or were glued on the tip of glass fibers. (Caveat: Our perfluorinated compounds have a tendency to dissolve in common cryoprotectants such as Parabar/Paratone). Data on all systems was recorded and reduced using the CrysAlisPro¹ Software. Structures were solved using WinGX² in combination with ShelXT³ and refined with shelXle⁴ and ShelXL. Tables for the publication were generated using a modified version of CifTab. Pictures of the structures were generated with Diamond 4⁵.

A.3) Crystal Data

All ellipsoids are depicted at 50% probability. The TDA and TEA cations are generally shown only as sticks. Fluorine and hydrogen substituents are left out for clarity, if necessary. All atoms involved in non-covalent interactions are labelled and connected via dashed bonds.

Atoms colours:

Atom	Colour	RGB
H	White	0/0/0
C	Black	255/255/255
N	Dark blue	0/53/96
F	Light green	153/204/0
Cl	Dark green	0/139/41
Br	Orange	218/87/0
I	Purple	128/0/128

A.2.1.) Crystal structures mentioned in the article

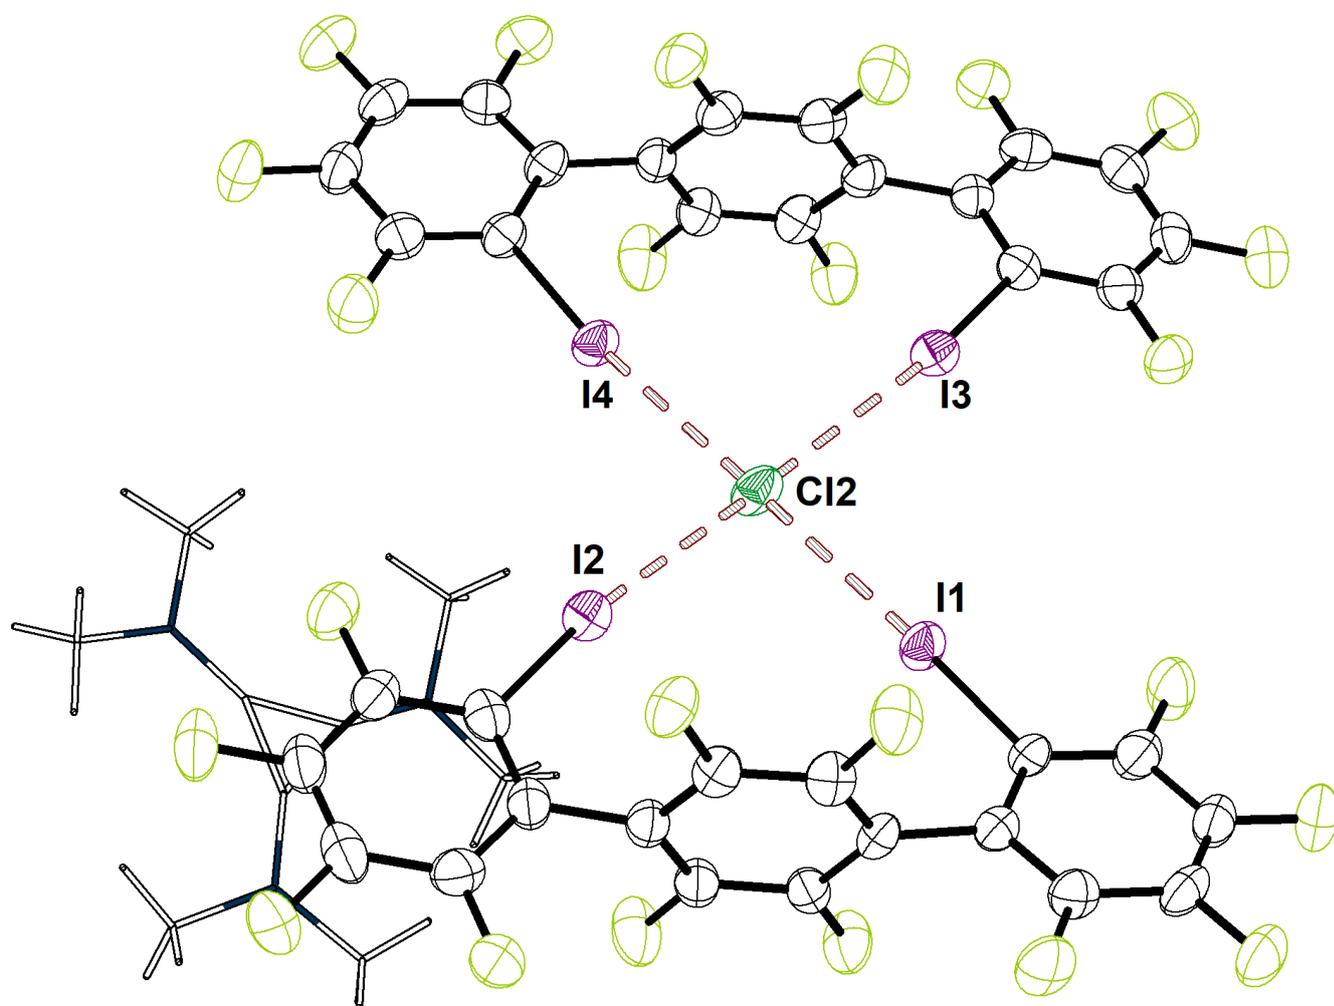

Figure S1: Cocystal structure of *syn-p-1* and TDA-Cl.

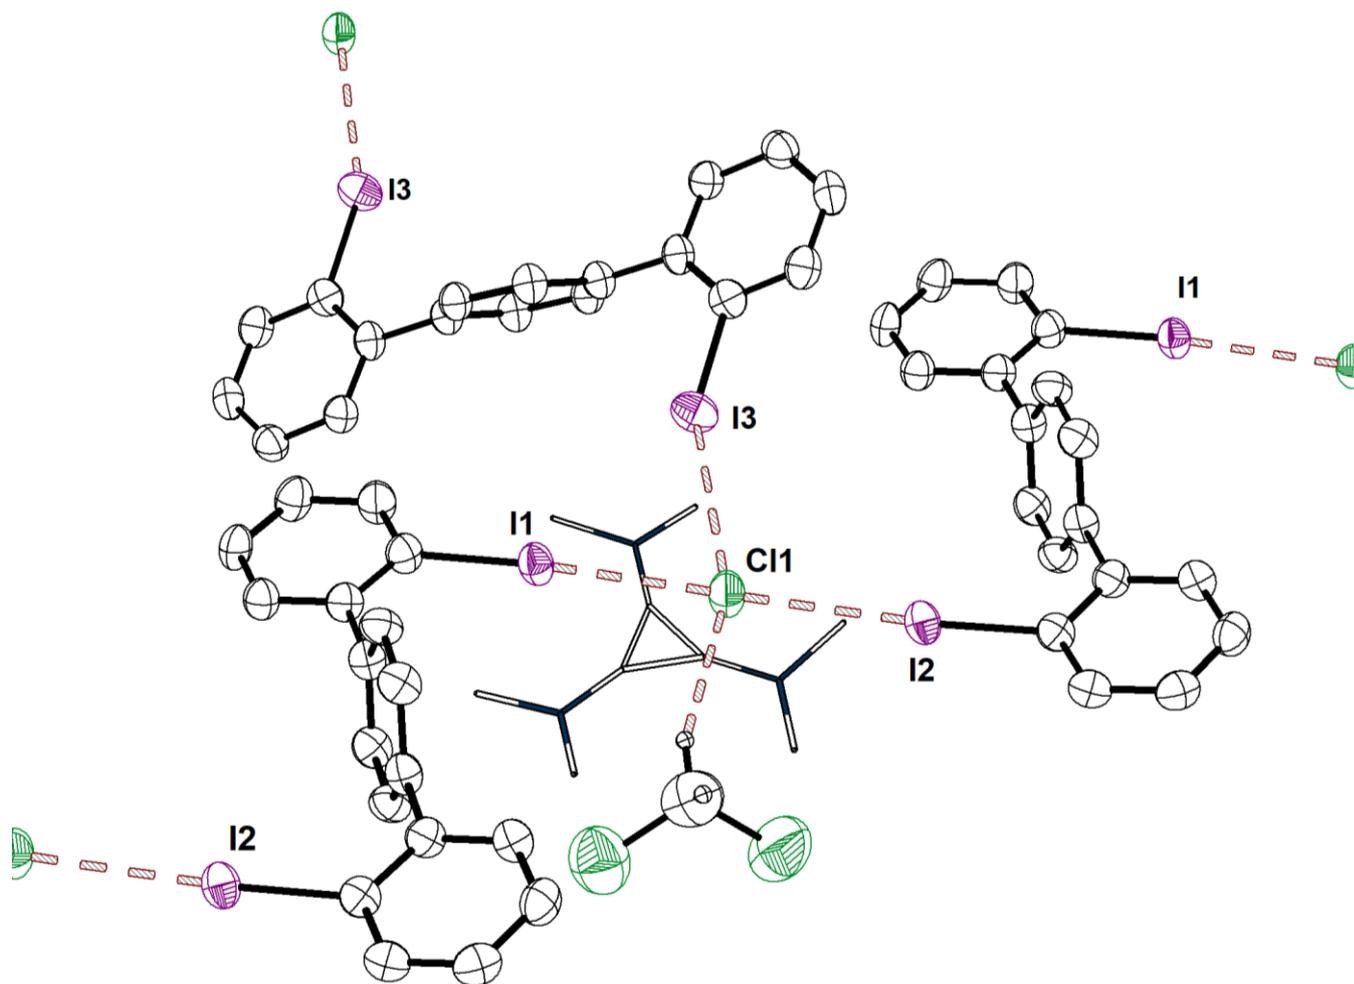

Figure S2: Cocrystal structure of *anti-p-1* and TDA-Cl.

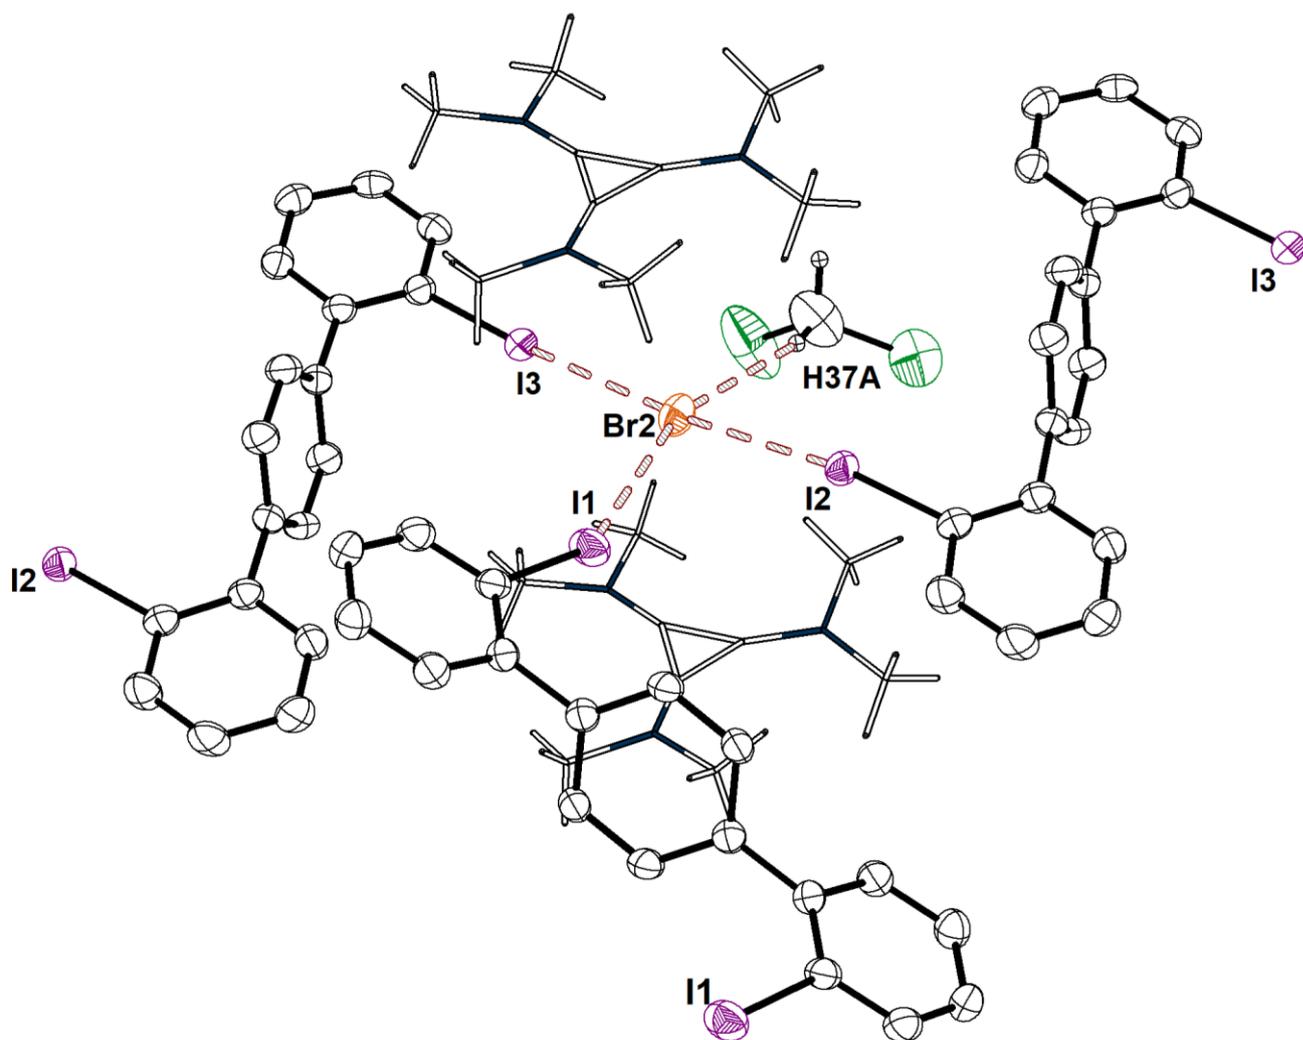

Figure S3: Cocrystal structure of *anti-p-1* and TDA-Br.

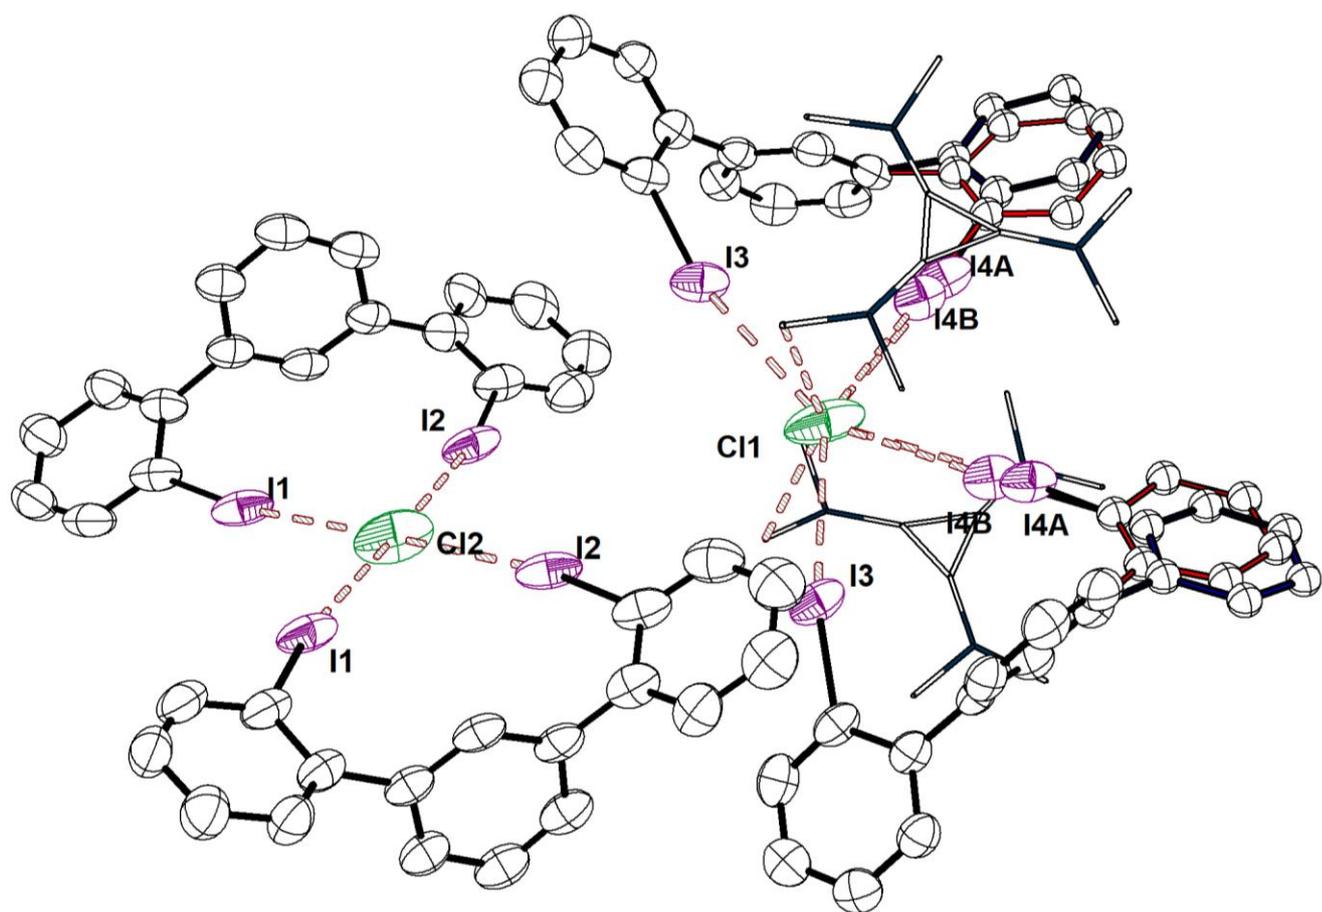

Figure S4: Cocrystal structure of *syn-m-1* and TDA-Cl. The disordered atoms on the right-hand side of the picture are shown as balls and sticks with red and blue bonds connecting the separate parts. Both chlorides are located on one of the twofold axes of the crystal. Attempts of solving the disorders of the chlorides resulted in non-positive defined ellipsoids and/or unstable refinements.

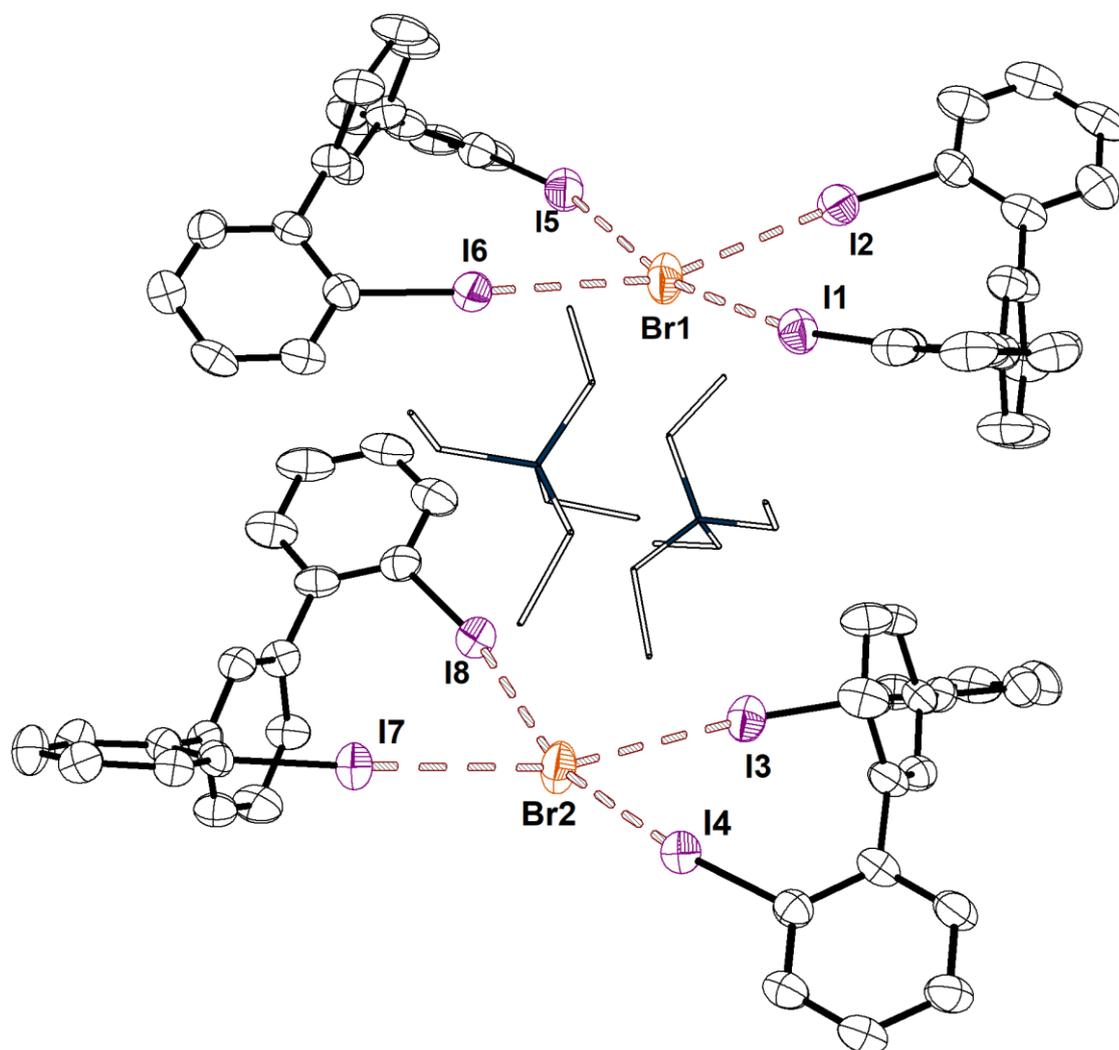

Figure S5: Cocrystal structure of *syn-m-1* and TEA-Br.

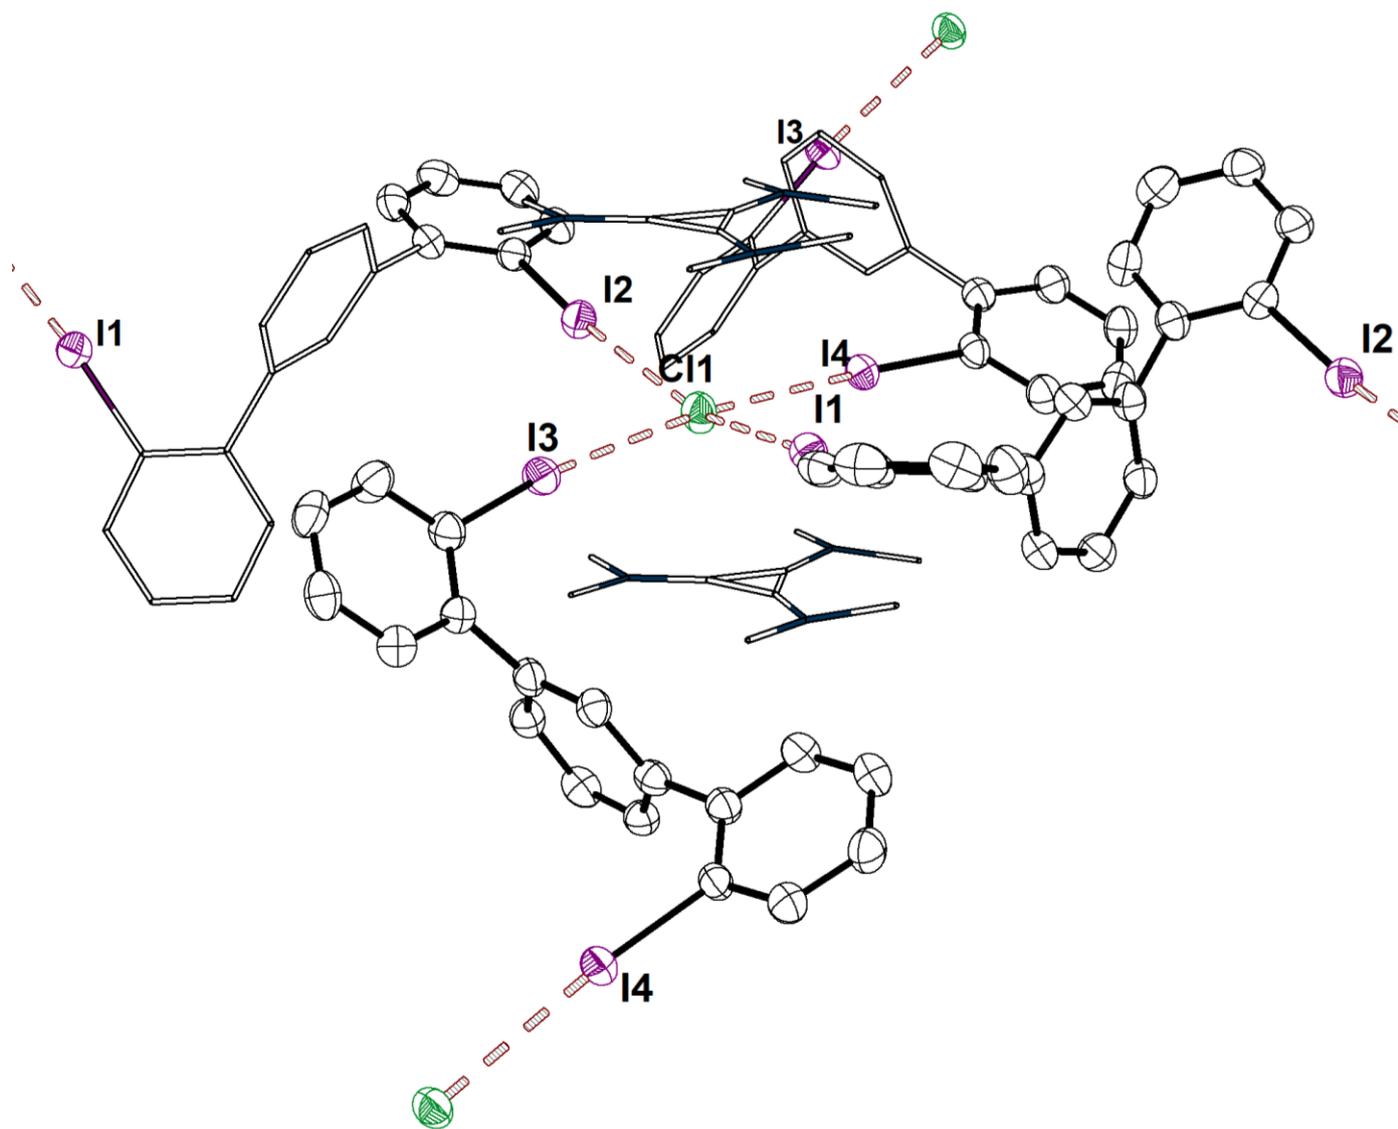

Figure S6: Cocrystal structure of *anti-m-1* and TDA-Cl.

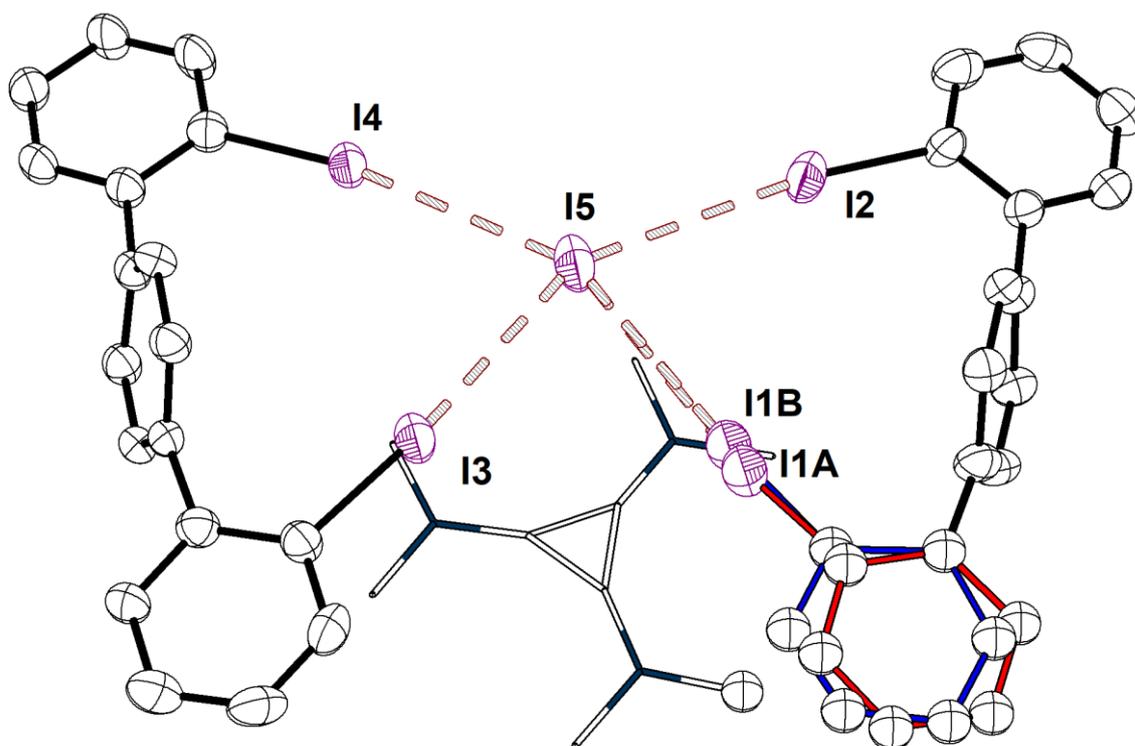

Figure S7: Cocrystal structure of **syn-p-1** and TDA-I. The disordered atoms are shown as balls and sticks, with bonds in red and blue, separating the two parts.

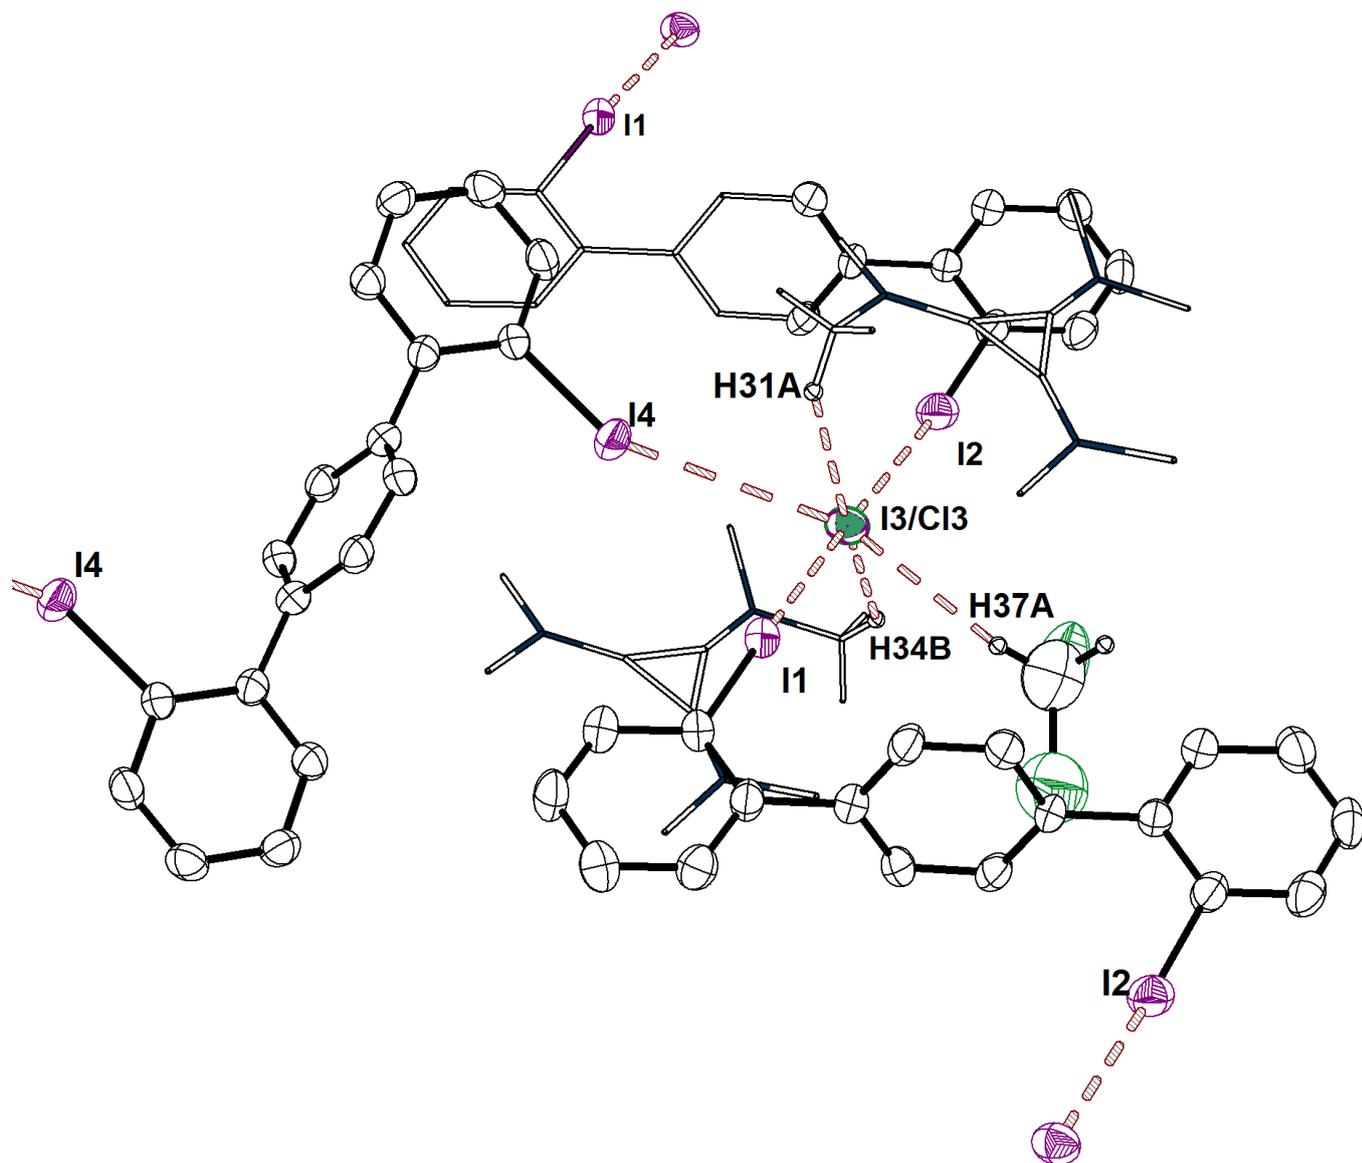

Figure S8: Cocrystal structure of *anti-p-1* and TDA-I. Iodide is replaced by chloride in about 40%. A solution with only iodide has a much larger R_{int} . We speculate that HCl contained in methylene chloride is the cause of the enrichment with chloride.

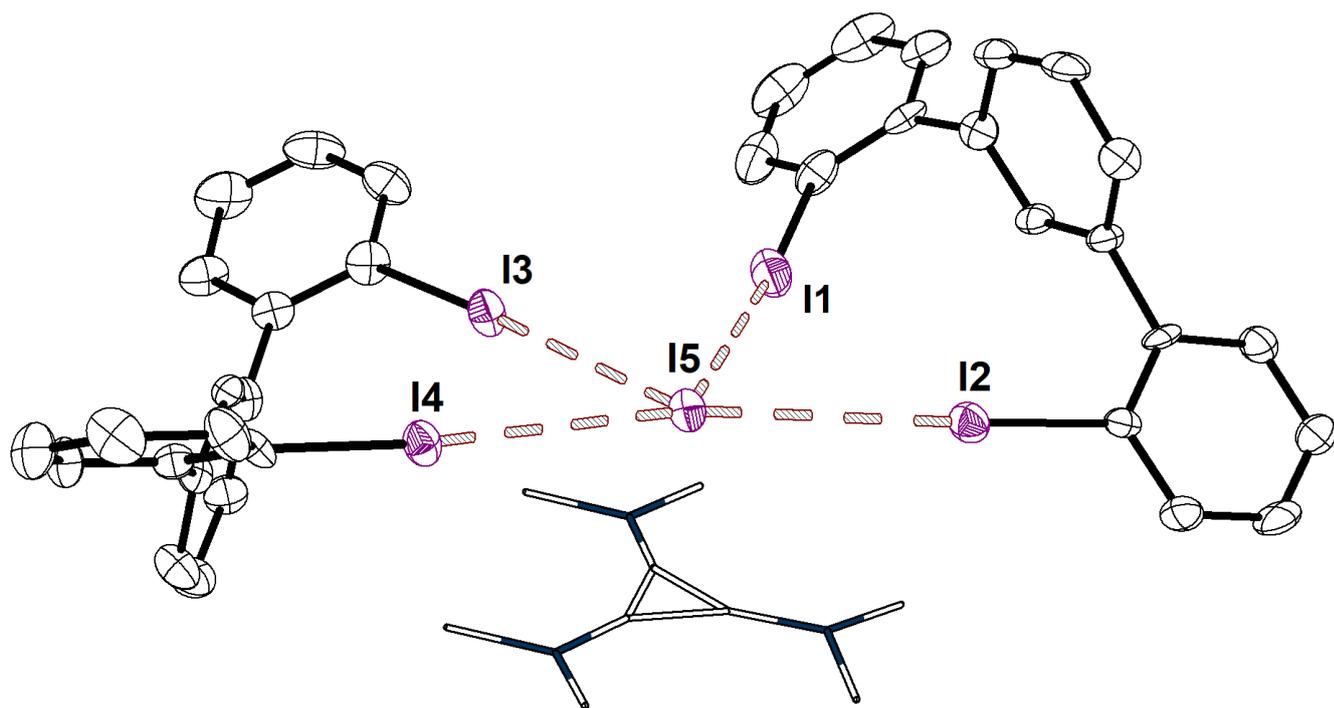

Figure S9: Cocrystal structure of *syn-m-1* and TDA-I.

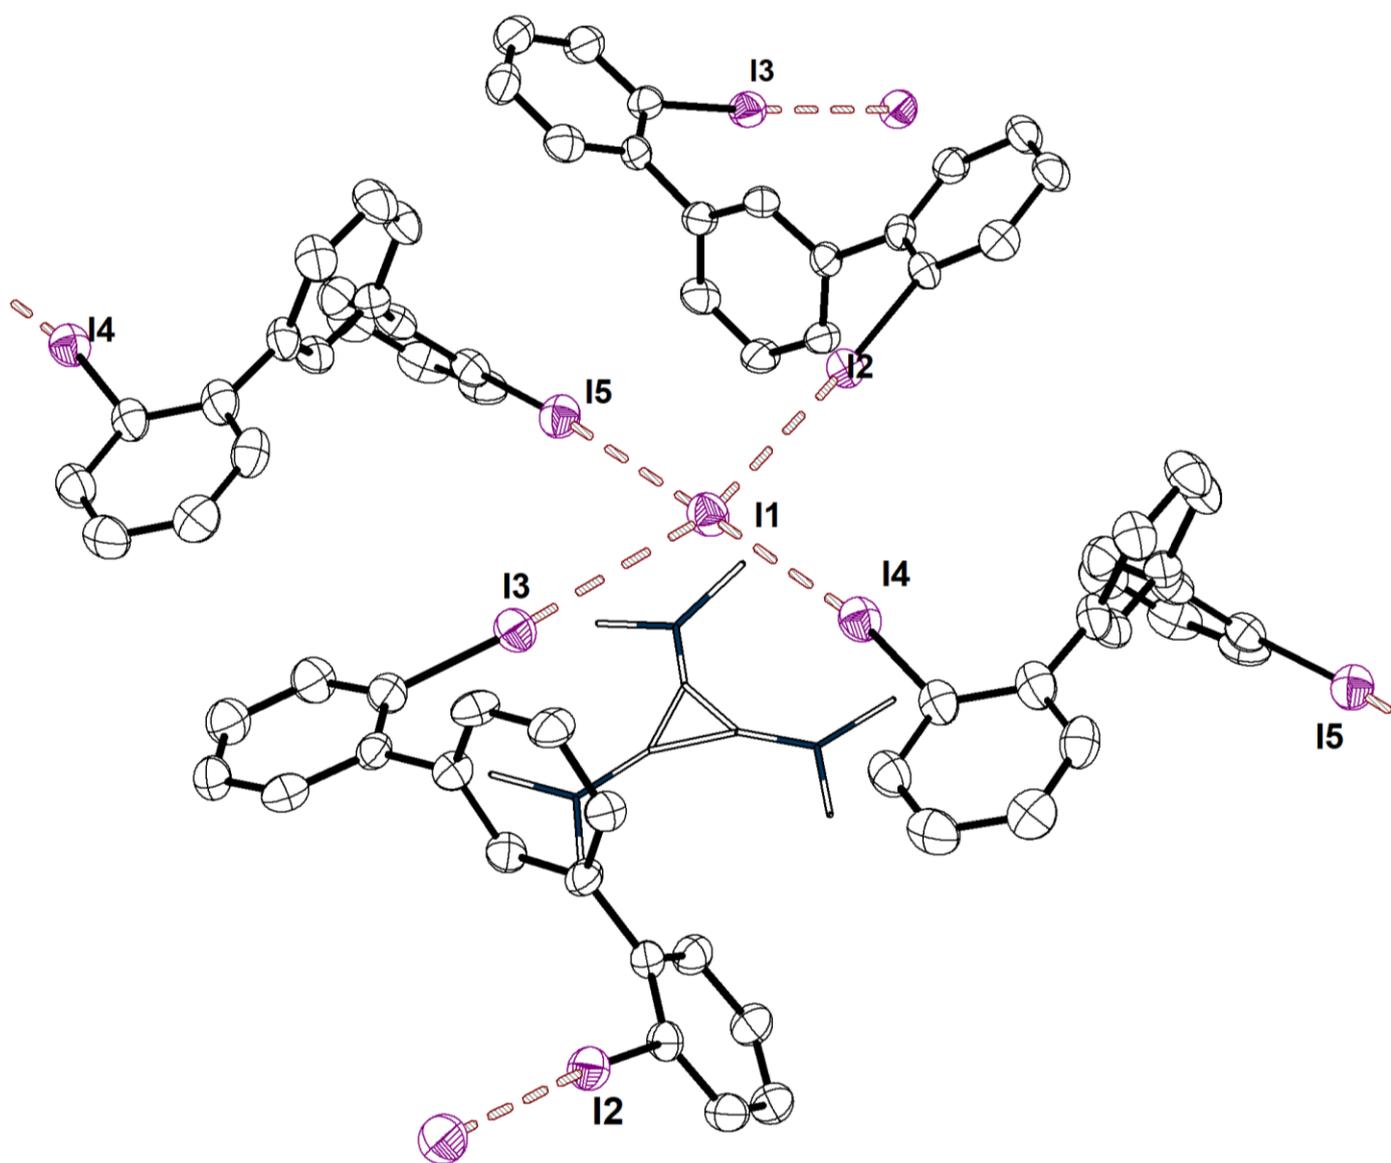

Figure S10: Cocrystal structure of *anti-m-1* and TDA-I.
