## Computational Information

Constraints were imposed in the models to best mimic the steric hindrance in the protein environment. The second sphere distal ligands Arg<sub>α</sub>98, Arg<sub>α</sub>170, Lys<sub>α</sub>211, and Lys<sub>α</sub>213 were retained in the model due to their positive charge and torsional flexibility. Water molecules present in the crystallographic data are expected to contribute to the reduction of the substrate via coordination with the residues; therefore, two water molecules are included in the active-site model (Figure S1). The distal ligands were truncated at the α-carbon.

**Figure S1.** Residue arrangement in constructed model (orange = Fe, brown = C, red = O, blue = N, white = H, yellow = S).

The siroheme, along with two attached carboxylate groups, were included in the model. Experimental studies suggest that the negatively charged carboxylate groups on the siroheme form a tight network with the positively charged residues and are therefore essential components of the active site.<sup>1</sup> Cysteine is the proximal ligand of iron and was truncated at its α-carbon.

Mutational studies suggest that Arg<sub>α</sub>98, Arg<sub>α</sub>170, Lys<sub>α</sub>211, and Lys<sub>α</sub>213 are structurally and mechanistically essential to the reactivity of the active site.<sup>3</sup> Previous research indicates that the catalytic residues surrounding the active site move in a range of 0.2 - 0.4 Å towards the substrate and effectively provide a caged proton concentration in the active site that stabilizes the negative charge of the substrate and carboxylate groups.<sup>2</sup> In an attempt to imitate the protein environment accurately, constraints were implemented on the residue ligands proximal to the active site. This approach has been successful in other protein studies.<sup>3, 4</sup> The N-terminus δ -carbon of Lys<sub>α</sub>211, Lys<sub>α</sub>213, α-carbon of Cys<sub>β</sub>182 and N-terminus γ- and δ-carbons of Arg<sub>α</sub>98 and Arg<sub>α</sub>170 were spatially constrained. Experimental crystallographic studies of substrate-bound structures show that the active site does not undergo significant conformational changes upon substrate binding.<sup>1</sup>

The predicted acidities of the side chains determined the active-site protonation scheme. The relative acidities of each residue were estimated using the PROPKA program.<sup>5, 6</sup> The well-suited proton donors, arginine, and lysine, have a typical pKa ~12.50 and ~ 10.50, respectively. In the protein environment, Lys<sub>α</sub>213 and Lys<sub>α</sub>211 are predicted to have a pKa ~ 6.59 and 9.67, respectively. Lysine has a pKa value close to physiological pH, making the chain a suitable proton donor. Additionally, Arg<sub>α</sub>170 and Arg<sub>α</sub>98 are predicted to have a pKa of ~11.33 and ~12.97 in the protein. Therefore, all four side-chain residues were protonated in this study. Sirs have been experimentally observed to activate various substrates.<sup>1</sup> For this reason, this study includes three substrates (HSO<sub>3</sub><sup>-</sup>, SO<sub>3</sub><sup>2-</sup>, and NO<sub>2</sub><sup>-</sup>). HSO<sub>3</sub><sup>-</sup> was identified from crystallographic data since one sulfur-oxygen bond was 0.2 Å longer than the others.<sup>2</sup>

**Table S1.** Geometric parameters (distances (d) in Å) of the heme species with ligands (without the cubane cluster) optimized at BP86/TZ2P level of theory, together with ligand interaction energies (E<sub>int</sub>) of the species at B3LYP//BP86/TZ2P, and TPSSh//BP86/TZ2P (kcal/mol)

**Table S7.** Cartesian coordinates ( $\text{\AA}$ ) of the siroheme species ( $\text{Fe}^{2+}$  &  $\text{Fe}^{3+}$ ) without ligands (and without the cubane cluster) optimized at DFT (BP86 functional) using TZ2P basis sets. S is the spin state of the species.

Siroheme ( $\text{Fe}^{2+}$ ) without $\text{HSO}_3^-$

**Table S8.** Cartesian coordinates ( $\text{\AA}$ ) of the heme species ( $\text{Fe}^{2+}$  &  $\text{Fe}^{3+}$ ) with ligands (and without the cubane cluster) optimized at DFT (BP86 functional) using TZ2P basis sets. S is the spin state of the species.

Heme ( $\text{Fe}^{2+}$ ) with $\text{HSO}_3^-$

**Table S9.** Cartesian coordinates ( $\text{\AA}$ ) of the heme species ( $\text{Fe}^{2+}$  &  $\text{Fe}^{3+}$ ) without ligands (and without the cubane cluster) optimized at DFT (BP86 functional) using TZ2P basis sets. S is the spin state of the species.

Heme ( $\text{Fe}^{2+}$ ) without $\text{HSO}_3^-$
