Supplementary Figures S1 to S6

Supplementary Tables S1 to S4

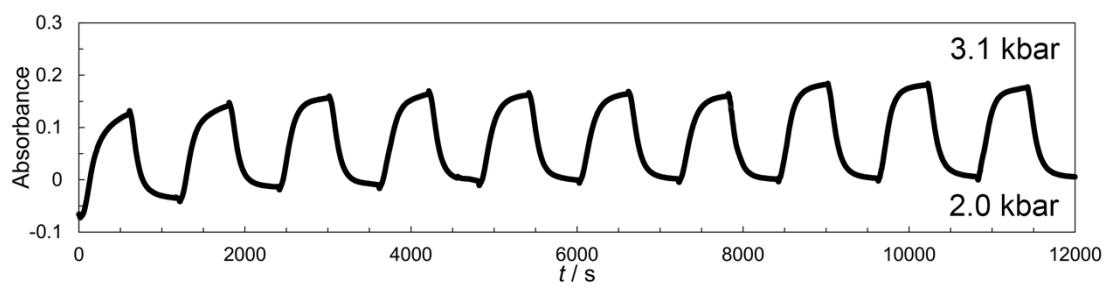

Figure S1. Changes in absorbance with 10 pressure-jump cycles between 2.0 kbar and 3.1 kbar at 9.3 °C. The time spent in 1-phase (2.0 kbar) or HP-LLPS (3.1 kbar) was approximately 600 s. This required ~5 s for pressurization up to 3.1 kbar but ~2 s for depressurization down to 2.0 kbar.

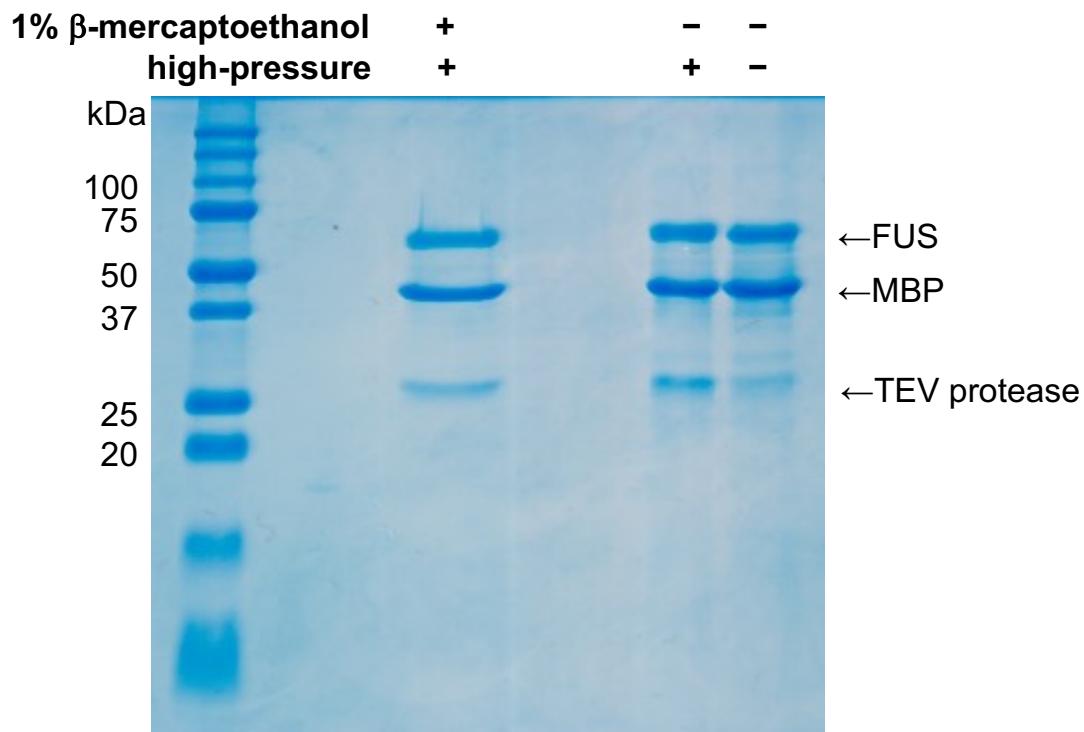

Figure S2. SDS-PAGE analysis of FUS before and after 3.1 kbar pressure treatment.

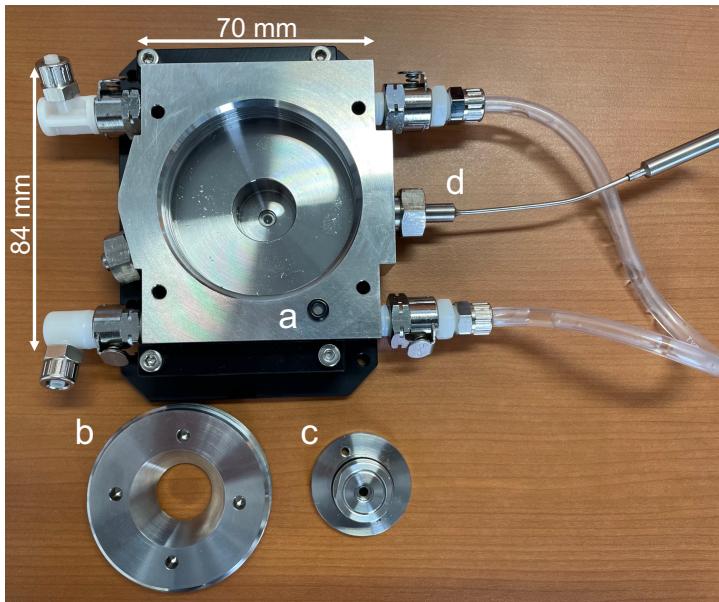

Figure S3. Pressure-resistant optical cell for microscopy (PMC-400; Syn-Corporation; a: i.d.=3 mm O-ring; b: grand nut; c: sapphire window unit; d: temperature detector).

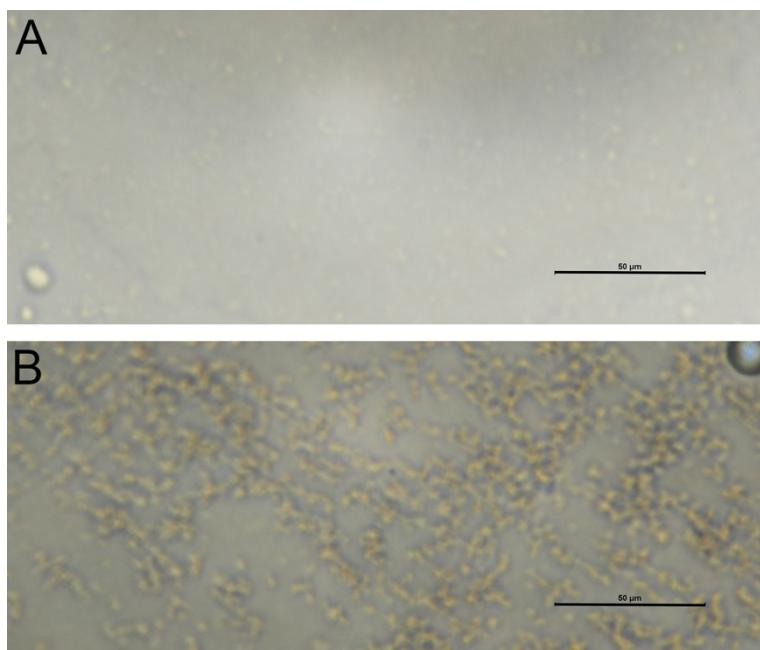

Figure S4. Reversibility and irreversibility of FUS-LLPS at 9.3 °C. (A) Microscopic image at 1.2 kbar after a 120 min incubation at 1 bar. (B) Microscopic image at 1 bar after a 120 min incubation at 3.1 bar. Black scale bar=50 μ m.

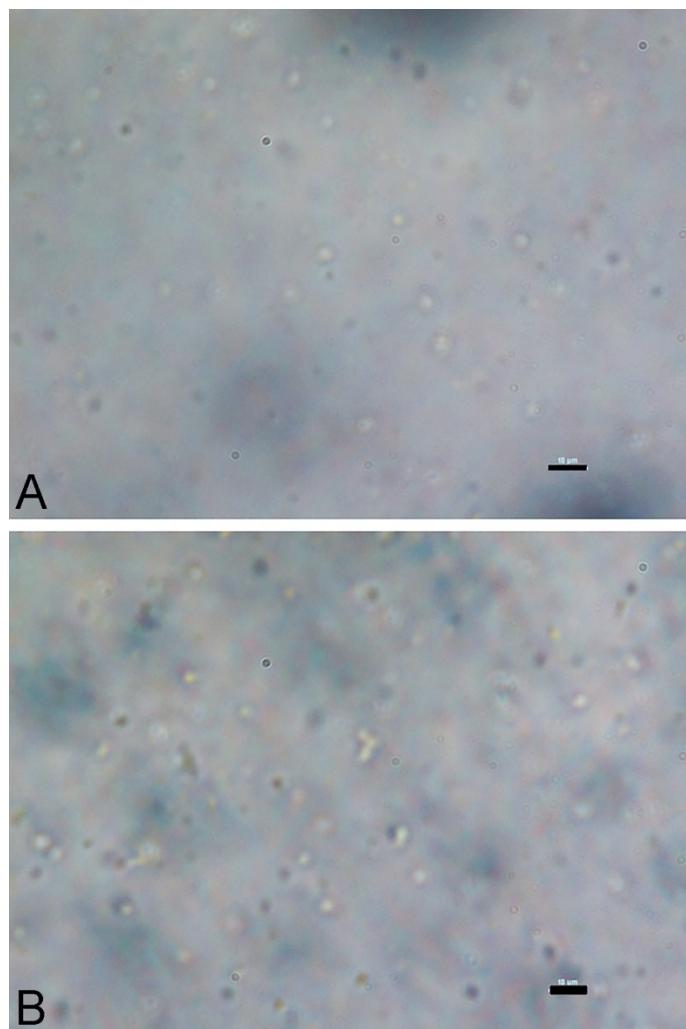

Figure S5. Microscopic images of FUS-LLPS. Images after 20 min (A) or 100 min (B) pressurization to 3.1 kbar at 9.3 °C, based on the middle layer of the sample chamber. Black scale bar=10 μ m.

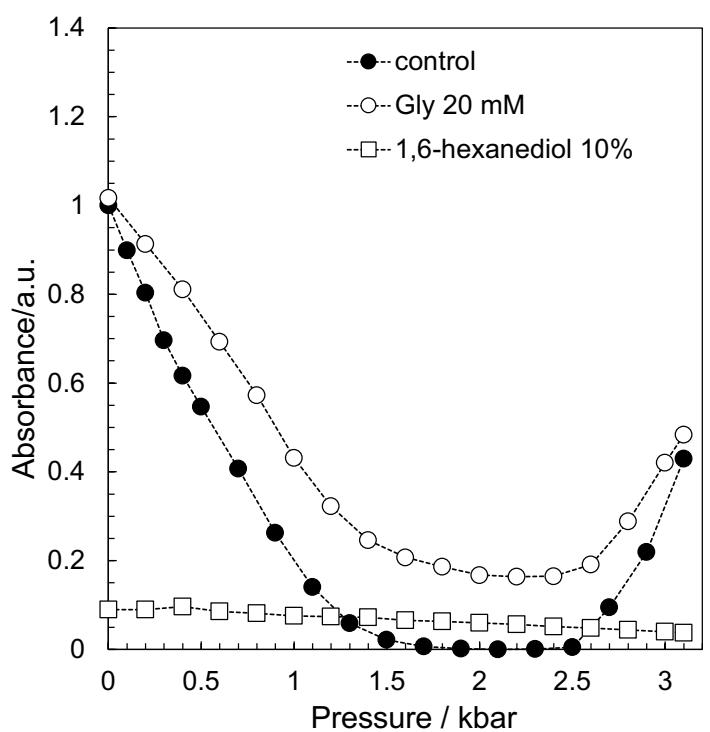

Figure S6. Effect of additives on LLPS formation with 5 μM FUS. Pressure-dependent changes in the absorbance of FUS in 20 mM glycine and 10% 1,6-hexanediol at 9.3 $^{\circ}\text{C}$. The absorbance was normalized to that without additives (i.e., control).

Table S1. Fluorescence recovery ratio after photobleaching of fused in sarcoma, FUS, less than 7 h after droplet formation.
