^a The general amber force field (GAFF)¹ was later updated to the second-generation GAFF (GAFF2),² e.g. using quantum mechanics (QM) calculations on more model compounds. RNA.OL3³ was developed from the ff99 force field⁴ highly exploiting QM calculations for sugars and phosphates, also with refinements of the glycosidic torsion, DNA.Bsc1⁵ development similarly includes QM and solvation models. Technically, DNA.Bsc1 largely consists of RNA.OL3 completed by other parameters. In our calculations, partial atomic charges as obtained from a QM computations were the same for all the four force fields.

^b Energy $\sim B[1 + \cos(n\tau - \varphi)]$, where B is the barrier and φ is the phase.

^a Only the P=O force constant was scaled (see ref. 54 in the main text), so that the PO stretching had similar systematic frequency error as other vibrations, and resultant spectrum could be more easily compared to the experiment, e.g. after one-step scaling of all frequencies.

ν ... stretching, δ ... bending.

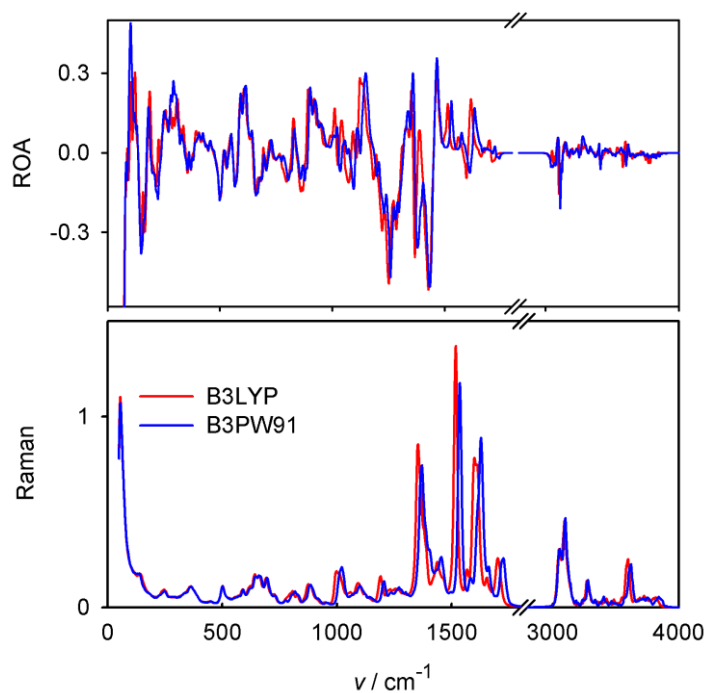

Figure S1. ROA and Raman spectra of a rGMP MD snapshot calculated with the B3LYP and B3PW91 functionals (for 6-31++G** and CPCM).

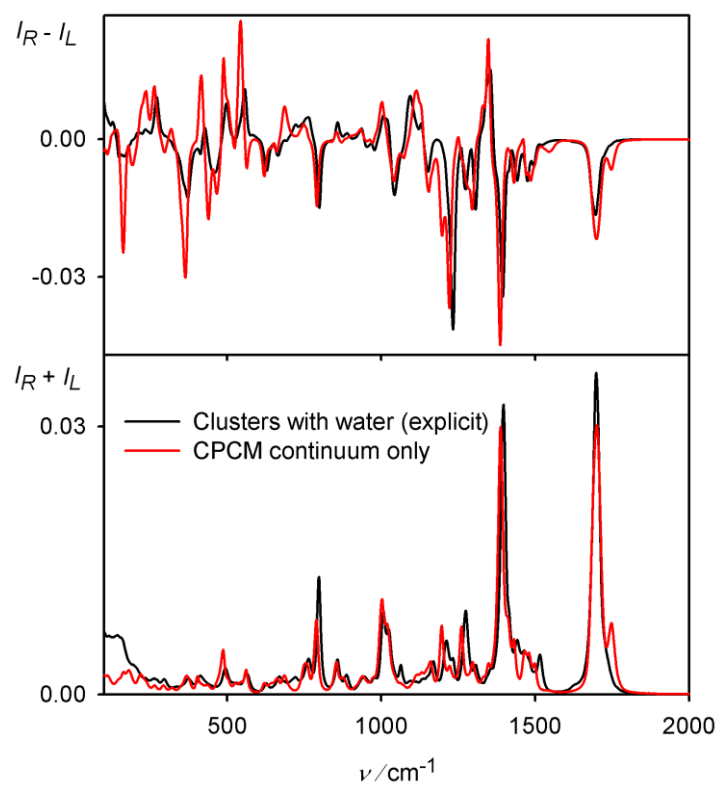

Figure S2. dTMP ROA and Raman spectra simulated from MD snapshots with explicit water molecules, and with CPCM only.

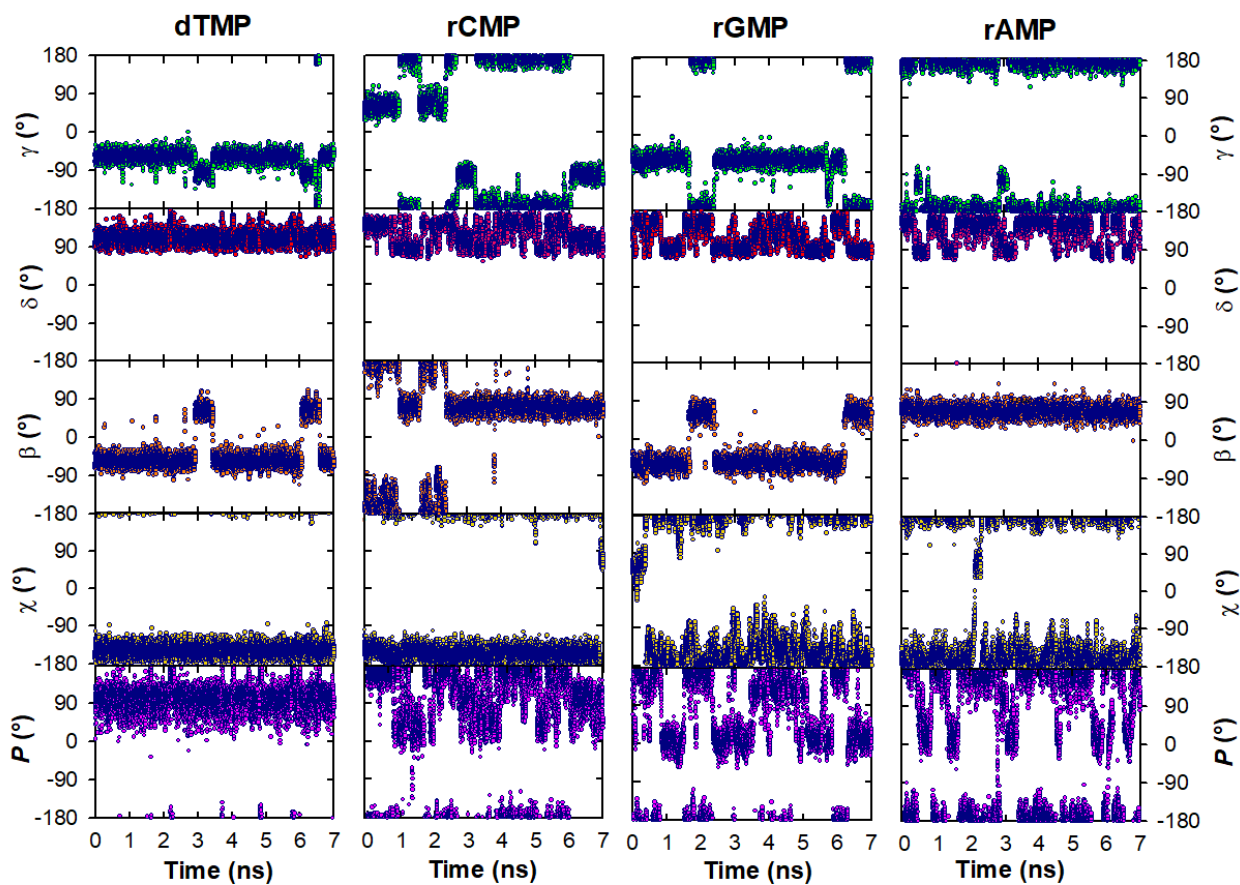

Figure S3. Time-evolution of selected geometrical parameters in the four nucleosides during MD, GAFF2 force field.

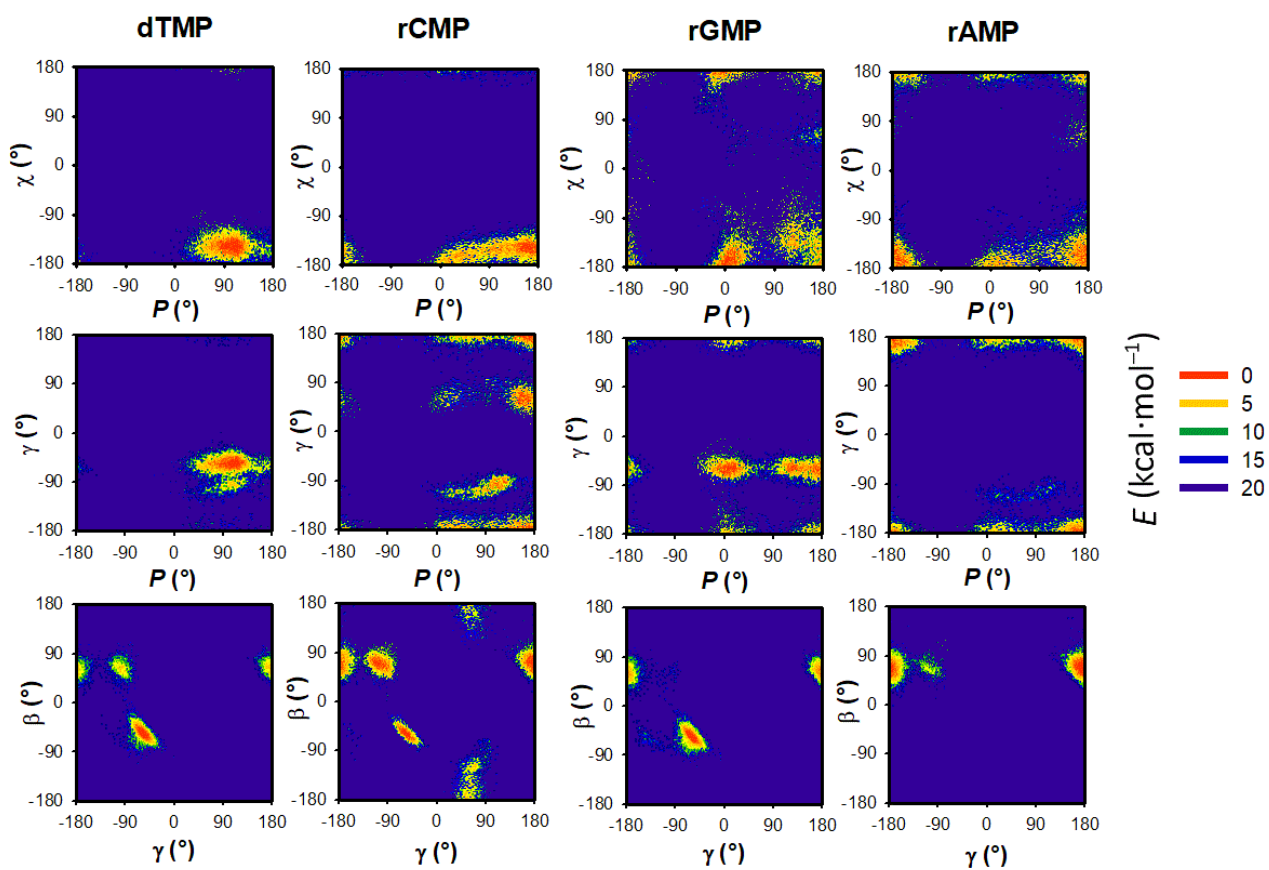

Figure S4. Dependence of the free energy on the backbone torsion angles (β , γ and δ), glycosidic bond torsion angle (χ) and pseudorotation angle (P), as obtained from free MD, GAFF2 force field.

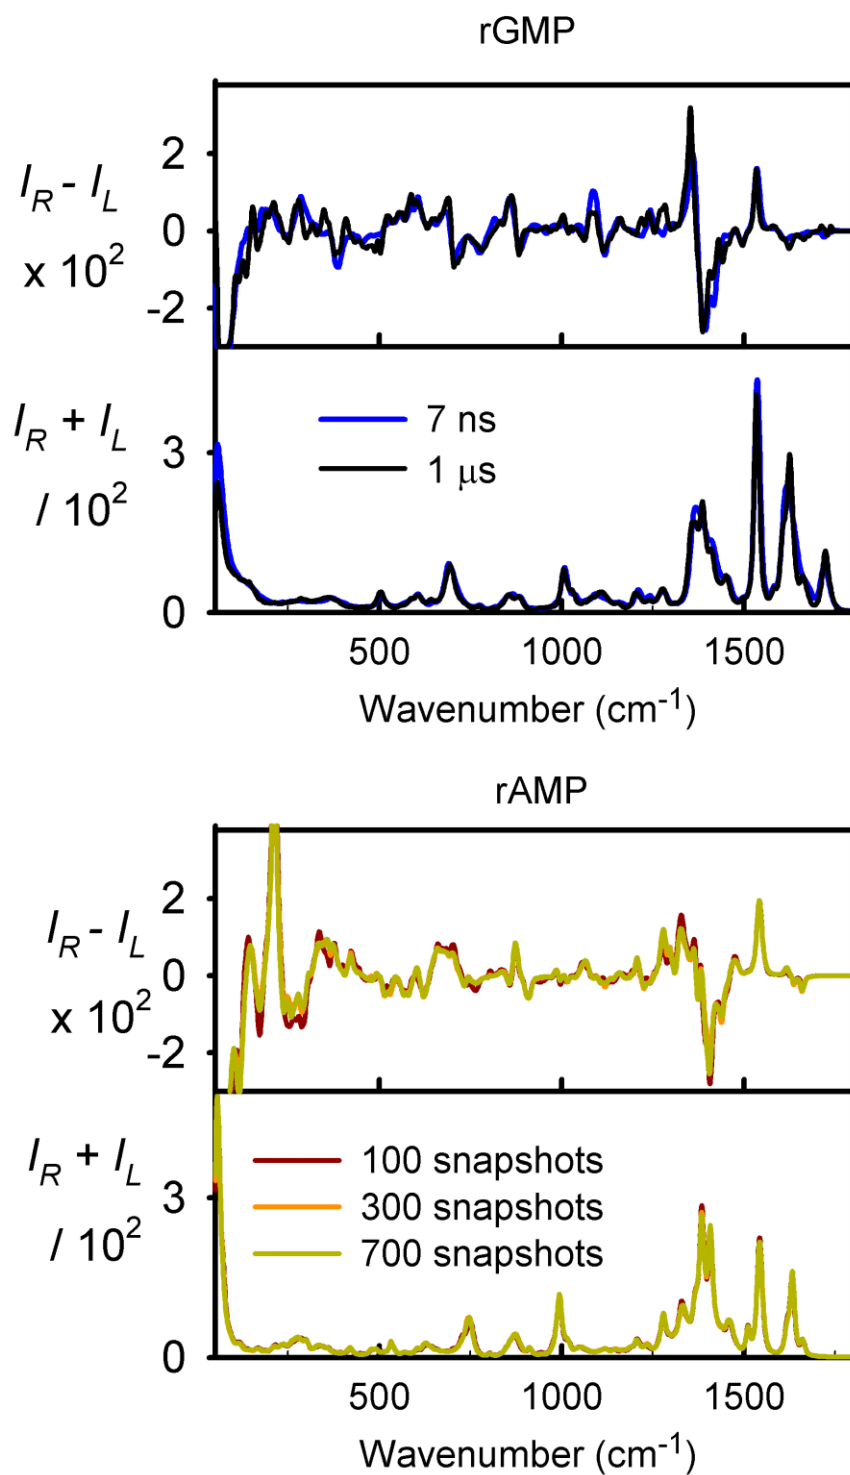

Figure S5. Convergence tests: rGMP spectra generated from 7 ns (700 snapshots, 10 ps intervals) and 1 μ s (100 snapshots, 10 ns intervals), and rAMP spectra generated with 100, 300 and 700 snapshots (10 ps intervals), free MD runs.

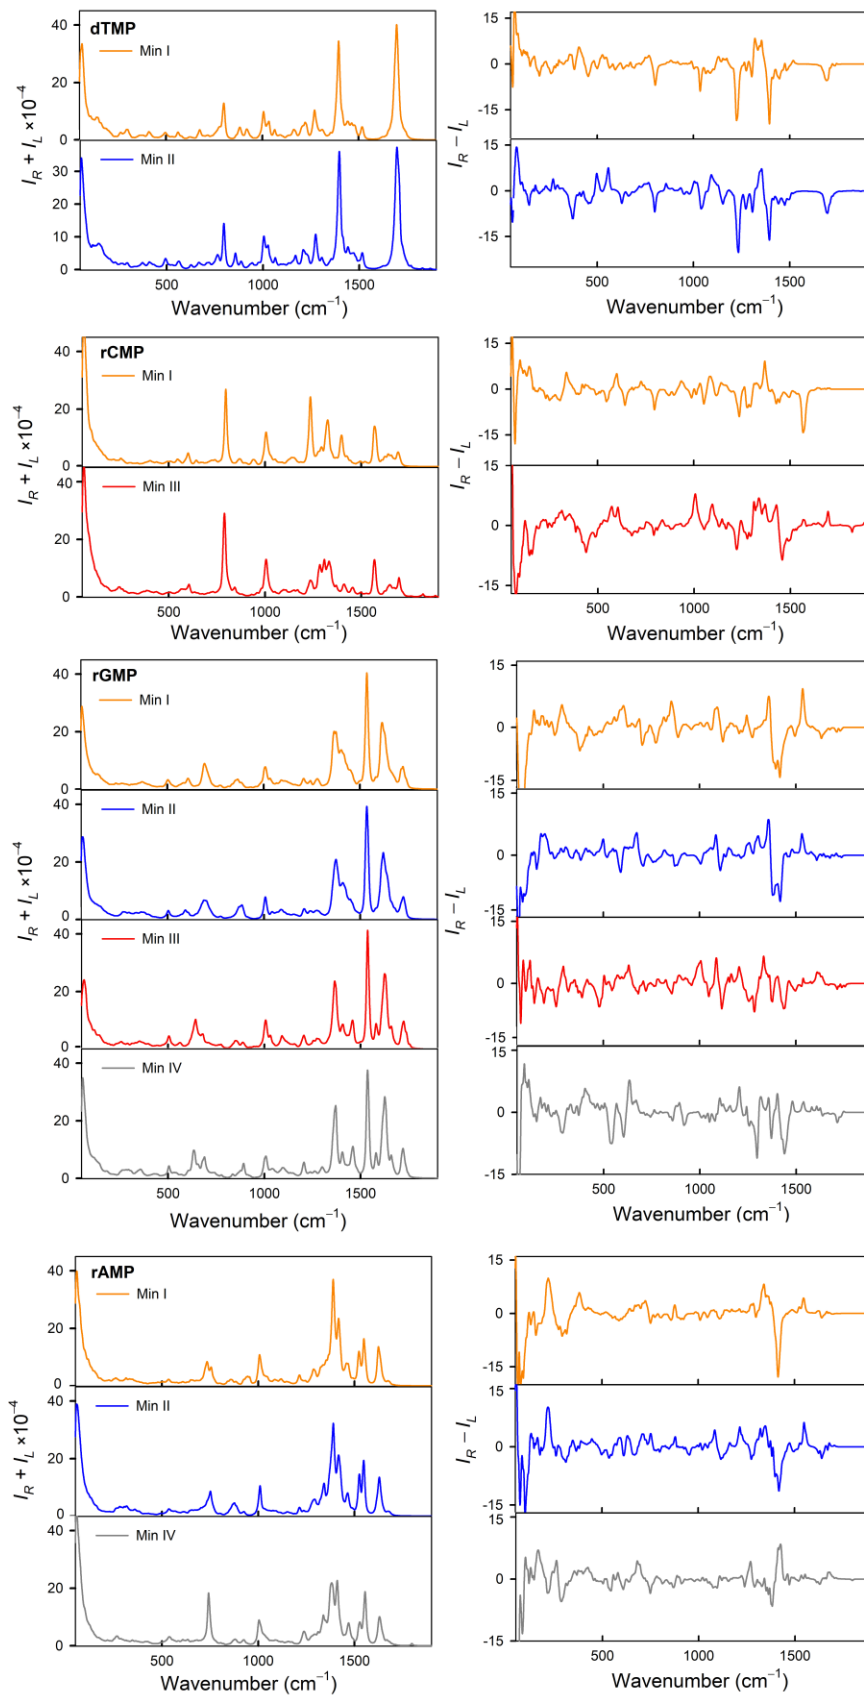

Figure S6. Raman and ROA spectra calculated for conformers corresponding to WHAM minima. Each spectrum is an average of at least 50 snapshots.

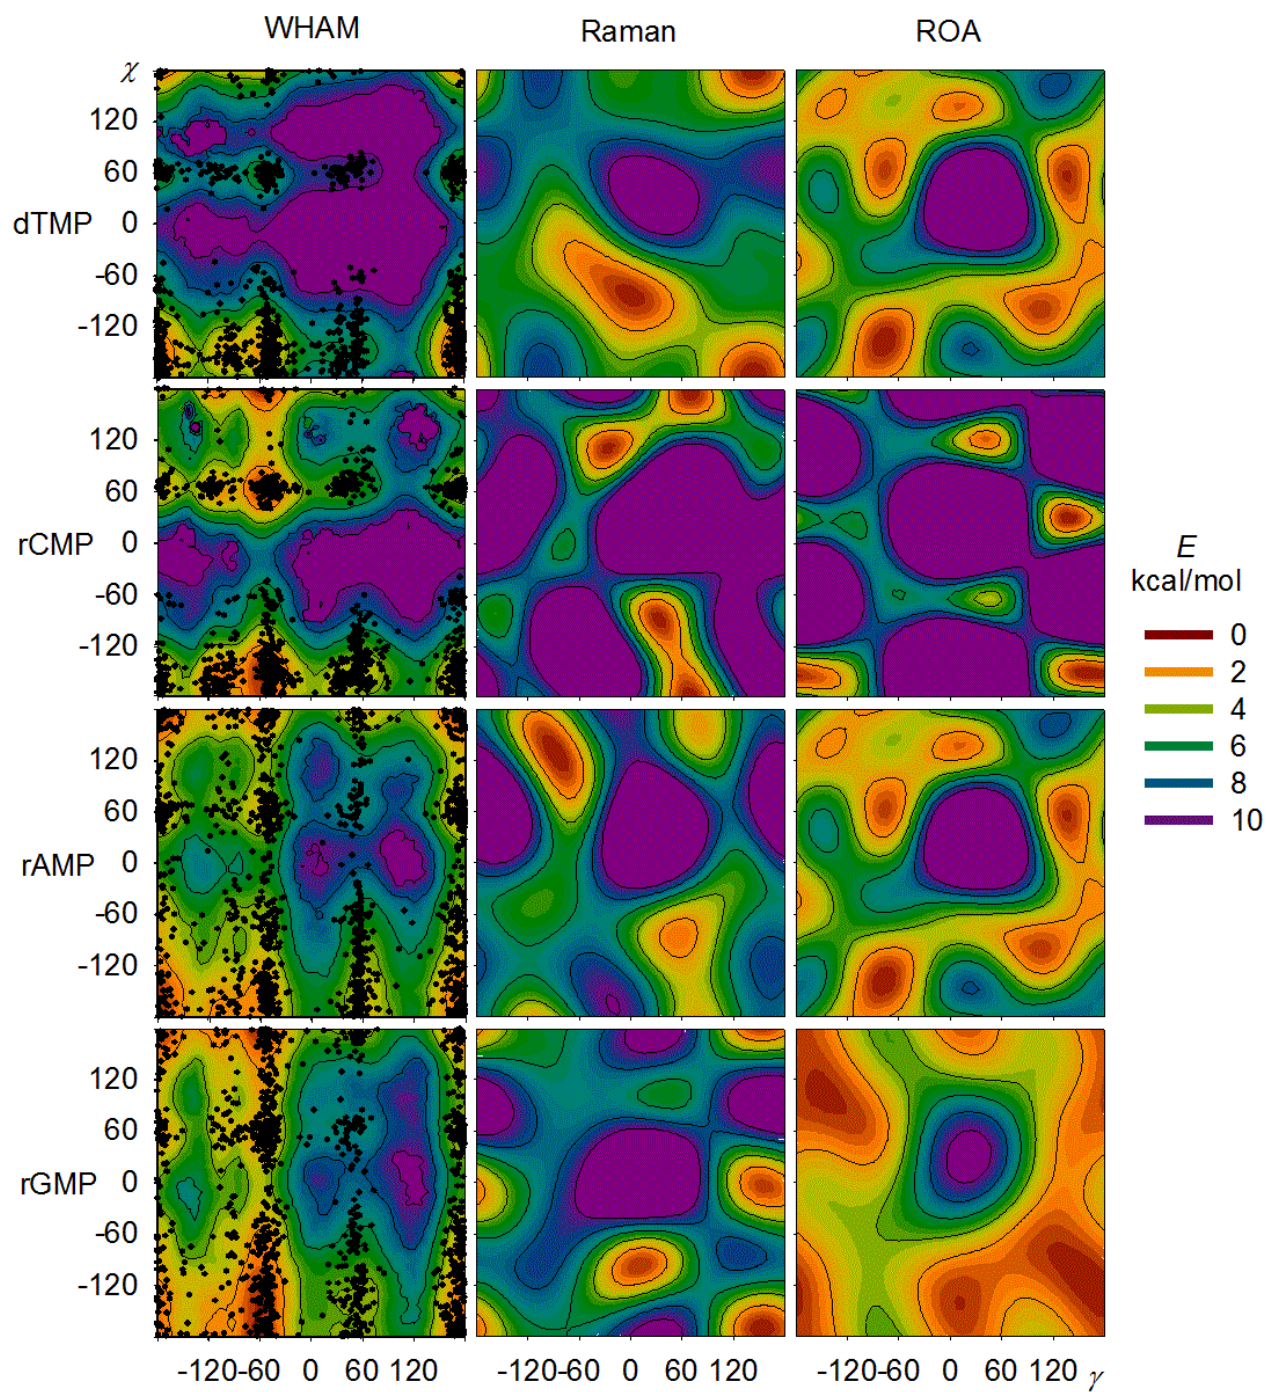

Figure S7. Dependence of the free energy on the (γ, χ) angles obtained by MD-WHAM, and arbitrary maps obtained by decomposition of experimental Raman and ROA spectra. The snapshots used in the decomposition are indicated by the black dots.

Figure S8. Calculated ROA spectra of the nucleotide conformers with *syn* or *anti* conformation of the base (MD average, frequency multiplied by 0.98), and the experiment. For dTMP the *syn* conformation was not present in MD. The experimental spectra are arbitrarily shifted and scaled in the intensity axis.
