Filtration and leaching test.

In order to confirm the heterogeneous nature of the catalyst system, we carried out a hot filtration test. After the reaction for 3 h, the autoclave was allowed to cool to room temperature and the excess gas was released, the catalyst was separated by filtration using PTFE membrane filter. 44.2% yield of furfuryl amine was achieved after analysing the reaction mixture by GC. Then, the catalytic reaction was continued for another 3 h with the filtrate under identical conditions. No noticeable improvement in furfuryl amine yield beyond 45.7% was observed.

After the filtration experiment, the filtrate was evaporated through rotary evaporator. The obtained product was dissolved and digested with HNO_3 solution and H_2O_2 solution. The resulting solution was cooled to room temperature followed by sonication. The solution was transferred into a 50 mL volumetric flask, diluted with deionized water, and the amount of Ni was measured by ICP-MS analysis. The ICP-MS analysis confirmed no obvious leaching of Ni took place in the filtrate, indicating the heterogeneous nature of this catalyst system.

Procedure for isolation and identification of products

A small amount of sample points were dipped into the TLC plate with a capillary tube, and the TLC plate was put into the prepared developing solvent (PE:EA= 2:1) for TLC detection, so that various components in the mixture moved to the corresponding position with the developing solvent, as shown in Fig. S2. The TLC plate was irradiated under an ultraviolet lamp to determine the product point in the desired sample. After determining the sample point, the mixture sample was spread on the PTLC plate at a position higher than the eluent liquid surface, and a horizontal sample band was formed under the irradiation of UV lamp. After drying, each ribbon carrying different compounds was scraped off the plate and extracted and washed with ethyl acetate to obtain filtrate, and then the solvent was removed to obtain pure compounds. The yield and purity of the products obtained were shown in the Table S2. Finally, the compound was dissolved in DMSO-*d*₆ and loaded into nuclear magnetic tube for nuclear magnetic testing, the ¹H NMR spectra were showed in Fig. S3-Fig. S5.
