## 1. Characterization

X-ray diffraction (XRD) patterns were recorded with a Rigaku Dmax-3C operated at 40 kV and 30 mA. Transmission electron microscopy (TEM) images and high-resolution transmission electron microscopy (HRTEM) were obtained on the JEOL-2010FEF at 200 kV. Electron paramagnetic resonance (EPR) spectra were recorded on an EMX PLUS spectrometer (Bruker). X-ray photoelectron spectroscopy (XPS) data were obtained on Perkin-Elmer PHI 5000. UV/Vis Diffuse Reflectance Spectra (DRS) were measured using a MC-2530 instrument spectrometer. Raman spectra were obtained by a confocal microprobe spectrometer (Thermo DXR Microscope). Fourier transform infrared spectroscopy (FTIR) spectra were performed using a Nicolet iS10 spectrometer. Photoelectrochemical measurements were performed on CHI660E workstation using three-electrode cell with a photocatalyst samples as working electrode, a Pt foil as counter electrode and a standard Ag/AgCl reference electrode, respectively. The N<sub>2</sub> adsorption performances were characterized by a temperature-programmed desorption instrument (TPD, TriStar II 3020). Photoluminescence (PL) spectra were performed on FLS1000 fluorescence spectrophotometer (Edinburgh Instruments).

## 2. Photocatalytic nitrogen fixation

The photocatalytic N<sub>2</sub> reduction experiments were performed at ambient conditions. Typically, 0.02g of catalyst was added into 80 mL deionized water. After the formation of a uniform catalyst suspension by ultrasonic treatment, the high-purity nitrogen was bubbled through the suspension to obtain a N<sub>2</sub>-saturated environment. A Xe lamp (300 W) was used as simulated solar light source, and the light source was turned on to start the reaction. Conditions: nitrogen was injected into the reaction system at a flow rate of 10 mL/min. The overall reaction time was 4 h, and samples were taken in 1 h. The

concentrations of  $\text{NH}_4^+$  were determined by Nessler's reagent method. The quantification of hydrazine ( $\text{N}_2\text{H}_4$ ) was measured by the method of Watt and Chrisp.
