1. Synthesis of TPA derivatives

4-(*tert*-Butyl)-*N*-(4-(*tert*-butyl)phenyl)-*N*-(4-methoxyphenyl)aniline (3)

To a solution of **1** (*p*-anisidine, 1.0 g, 8.12 mmol) in toluene (30 mL), **2** (1-bromo-4-*tert*butylbenzene, 3.52 mL, 20.3 mmol) and *t*-BuONa (2.34 g, 24.3 mmol) was added. The system was purged with nitrogen several times. Then, P(*t*-Bu)₃ (394 mg, 1.95 mmol) and Pd(OAc)₂ (218 mg, 0.97 mmol) were added to the mixture, and the solution was heated to reflux overnight. After cooling to room temperature, the resulting mixture was quenched by water, extracted with ethyl acetate (3×20 mL), and then dried over Na₂SO₄. The crude product was purified by column chromatography on silica gel (petroleum ether/ethyl acetate = 99:1 v/v) to afford 4-(*tert*-butyl)-*N*-(4-(*tert*-butyl)phenyl)-*N*-(4-methoxyphenyl)aniline (**3**) as a white solid (2.3 g, 73%; mp: 142.3-143.3 °C). ¹**H** NMR (400 MHz, CDCl₃) δ ppm: 7.30 – 7.25 (m, AA' part of AA'BB' system, =CH, 4H), 7.15 – 7.11 (m, AA' part of AA'BB' system, =CH, 2H), 7.04 – 7.00 (m, BB' part of AA'BB' system, =CH, 4H), 6.90 – 6.86 (m, BB' part of AA'BB' system, =CH, 2H), 3.84 (s, CH₃, 3H), 1.36 (s, CH₃, 18H). ¹³C NMR (100 MHz, CDCl₃) δ ppm: 155.8, 145.7, 144.4, 141.2, 127.0, 125.9, 122.4, 114.7, 55.5, 34.2, 31.5.

4-(Bis(4-(tert-butyl)phenyl)amino)phenol (4)

To a solution of 4-(*tert*-butyl)-*N*-(4-(*tert*-butyl)phenyl)-*N*-(4-methoxyphenyl)aniline (2.0 g, 5.16 mmol) in CHCl₃ (30 mL) at 0 °C, a solution of BBr₃ (1.74 mL, 18.1 mmol) in CHCl₃ (10 mL) was added slowly with dropping funnel under stirring. After stirring for 1 h at this temperature, the reaction mixture was allowed to warm to room temperature and stirred for an additional 24 h. The reaction was carefully quenched with NH₄Cl solution using an ice bath and the resulting solution was washed with water (2 × 30 mL), dried over Na₂SO₄, and evaporated to afford compound **4** as

a white solid (1.7 g, 88%; mp: 177.5-178.5 °C). ¹H NMR (400 MHz, DMSO-*d*₆) δ ppm: 9.34 (bs, OH, 1H), 7.23 – 7.19 (m, AA' part of AA'BB' system, =CH, 4H), 6.89 – 6.85 (m, AA' part of AA'BB' system, =CH, 2H), 6.83 – 6.79 (m, BB' part of AA'BB' system, =CH, 4H), 6.75 – 6.71 (m, BB' part of AA'BB' system, =CH, 2H), 1.24 (s, CH₃, 18H). ¹³C NMR (100 MHz, DMSO-*d*₆) δ ppm: 154.1, 145.4, 143.5, 138.5, 127.4, 125.8, 121.5, 116.2, 33.8, 31.2.

3. Photophysical measurements

Flouresence Quantum Yield Calculation

In order to evaluate the photophysical properties of **p-ZnPc** and **p-CuPc**, fluorescence quantum yields (Φ_F) were determined using a comparative method (eqn (1)) where a solution of unsubstituted ZnPc ($\Phi_F = 0.25$) in THF was used as a standard¹.

$$\Phi_{F} = \Phi_{F_{Std}} \frac{F \cdot A_{Std} \eta^2}{F_{Std} \eta_{Std}^2}$$
(Eq. 1)

In this equation, F, Fstd, A, and Astd represent the fluorescence bands areas and absorbance values at the excitation wavelength for the sample and standard.

Time-correlated single-photon counting fluorescence measurements were performed to directly determine the fluorescence lifetime of compound **p-ZnPc** and **p-CuPc** with appropriate calculation

Solid-state bandgap measurement by diffuse reflectance spectra (DRS)

The energy required to excite an electron from the valence band to the conduction band is defined as the bandgap, which is essential in investigating semiconductors' photophysical and photochemical properties. The equation proposed by Tauc² in 1966 and developed with the contributions of Davis and Mott³ is given as equation 2.

. .

$$(\alpha . h\nu)^{1/\gamma} = A (h\nu - E_g)$$
 Eq. 2

where h: Planck's constant, ν : frequency of photons α : energy-dependent absorption coefficient, E_g : solid-state bandgap, A: constant. The γ factor depends on the electron transition and equals 1/2 or 2 at the direct and indirect transition bandgap, respectively⁴.

The solid-state band gap energy is often determined by diffuse reflectance spectra (DRS). Firstly, the measured DRS spectra were converted into absorption spectra by applying the Kubelka-Munk function given in equation 2.

$$F(R_{\infty}) = \frac{K}{S} = \frac{(1 - R_{\infty})}{2R_{\infty}}$$
 Eq. 3

where K: absorption coefficient, S scattering coefficient, $R_{\infty} = R_{\text{sample}}/R_{\text{standard}}$, represents the reflection of an infinitely thick sample. The Tauc plot final equation obtained by putting $F(R_{\infty})$ instead of the value given in equation 1 is given below as equation 3.

$$\left(F(R_{\infty}). h\nu\right)^{1/\gamma} = A (h\nu - E_g)$$
 Eq. 4

The spectra were recorded using a UV-vis spectrophotometer (UV-2600 Shimadzu) equipped with an integrated sphere attachment and a powder sample holder. The collected $R\infty(\lambda)$ spectra were transformed according to eqs 2 and the direct allowed transition, the value of the γ is used as 1/2.
