General remarks
All manipulations of oxygen- and moisture-sensitive materials were conducted with a standard Schlenk technique under an argon atmosphere. Nuclear magnetic resonance spectra were taken on a Varian System 500 (\(^1\)H, 500 MHz; \(^{13}\)C, 125 MHz; \(^{11}\)B, 186 MHz; \(^{31}\)P, 202 MHz) or a Varian 400MR (\(^1\)H, 400 MHz) spectrometer using residual chloroform (\(^1\)H, \(\delta = 7.26\)), CDCl\(_3\) (\(^{13}\)C, \(\delta = 77.16\)), or tetramethylsilane (\(^1\)H and \(^{13}\)C, \(\delta = 0\)) as an internal standard, and boron trifluoride diethyl etherate (\(^{11}\)B, \(\delta = 0.00\)) or 85% H\(_3\)PO\(_4\) (\(^{31}\)P, \(\delta = 0.00\)) as an external standard. \(^1\)H NMR data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), coupling constants (Hz), integration. GC analysis was performed on a Shimadzu GC-2014 (GC conditions: Column: TC-1 (GL Science), 30 m \(\times\) 0.25 mm, film 0.25 \(\mu\)m; Flow rate: 1.89 mL/min; Injector temperature: 250 °C; Oven temperature: 100 °C to 250 °C at 20 °C/min, hold at 250 °C for 10 min; FID temperature: 250 °C). High-resolution mass spectra were obtained with a Thermo Fisher Scientific LTQ Orbitrap XL or JEOL JMS-T100GCV spectrometer. Preparative recycling gel permeation chromatography was performed with GL Science PU 614 equipped with Shodex GPC H-2001L and -2002L columns (toluene as an eluent). Column chromatography was carried out using Merck Kieselgel 60 or Florisil. Unless otherwise noted, commercially available reagents were used without purification. All solvents were dried over activated molecular sieve 4Å.

Synthesis of silylborane
**PhMe\(_2\)Si–B(dan) (1)**

![Structure of PhMe\(_2\)Si–B(dan)](image)

To a toluene (10 mL) solution of 1,8-diaminonaphthalene (0.633 g, 4.00 mmol) was added PhMe\(_2\)Si–B(Ni-Pr\(_2\))\(_2\)\(^1\) (1.43 g, 4.12 mmol) at room temperature, and the mixture was stirred at 125 °C for 6 h. Evaporation of volatile components followed by silica gel column chromatography (hexane as an eluent) gave 1 (0.967 g, 80% yield) as a pale yellow powder.

Stability test of silylboranes under dried air conditions

A flame dried Schlenk tube were charged with 1 (9.07 mg, 0.0300 mmol) and PhMe₂Si–B(pin) (7.87 mg, 0.0300 mmol), anisole (an internal standard, 9.73 mg, 0.0900 mmol) and benzene-d₆ (7 mL) under an argon atmosphere. A part of this solution (0.7 mL) was transferred to an NMR tube filled with dried air, and recovery of silylboranes was determined by ¹H NMR.

Pt-catalyzed silylboration of alkynes: a general procedure

A flame dried Schlenk tube were charged with Pt(PPh₃)₄ (2.49 mg, 2.00 µmol), an alkyne (0.150 mmol), 1,2-diethoxyethane (0.12 mL) and a silylborane (0.100 mmol, 1: 30.2 mg; PhMe₂Si–B(pin): 26.2 mg), and the mixture was stirred at 110 °C for 22 h. After the solvent was evaporated, the residue was purified by preparative recycling gel permeation chromatography (toluene as an eluent) to afford the product.

Direct cross-coupling of 3a

A flame-dried Schlenk tube equipped with a magnetic stirring bar were charged with Pd(PPh$_3$)$_4$ (15.0 mg, 0.013 mmol), 3a (108.2 mg, 0.26 mmol), 4-bromoanisole (48.6 mg, 0.26 mmol), and 1,4-dioxane (1.73 mL). The mixture was stirred at 100 °C for 5 min before addition of t-BuOK (1 M in THF, 0.40 mL, 0.40 mmol). The resulting mixture was stirred at 100 °C for 1 h. After quenching the mixture with brine (20 mL), the resulting mixture was extracted with EtOAc (15 mL × 3). The organic solution was dried over MgSO$_4$ and evaporated in vacuo. The residue was purified by silica gel column chromatography (Hexane/EtOAc as an eluent) to give a cross-coupling product.

Copper-catalyzed reaction of 1 with 1-octyne

A flame dried Schlenk tube were charged with SIMesCuCl (2.0 mg, 5.0 µmol), t-BuONa (2.0 mg, 0.02 mmol) and THF (0.56 mL). The solution was allowed to stir at 22 °C for 2 h. Then 1 (158.7 mg, 0.525 mmol) was added to the solution, and the mixture was allowed to stir at 22 °C for 30 min. 1-Octyne (55.1 mg, 0.50 mmol) and MeOH (30 µL, 0.75 mmol) were added. The resulting mixture was allowed to stir at 22 °C for 12 h before the reaction was quenched by passing the mixture through a short plug of celite and silica gel and eluted with ether (3 × 2 mL). The filtrate was concentrated in vacuo to provide a crude product, which was purified by silica gel chromatography (Hexane/EtOAc as an eluent) to afford the product.

Copper-catalyzed reaction of 1 with 1-phenyl-1-propyne

1-Phenyl-1-propyne (23.2 mg, 0.2 mmol) and 1 (72.5 mg, 0.24 mmol) were added with the aid of THF (0.2 mL) to a mixture of CuI (3.8 mg, 0.02 mmol) and \( t \)-BuONa (7.7 mg, 0.08 mmol) in THF (0.8 mL), and the resulting mixture was stirred at 40 °C for 20 h. This was passed through a pad of silica gel with EtOAc and the solvent was removed under vacuum. The residue was purified by preparative recycling gel permeation chromatography (chloroform as an eluent) to afford the product.

A mixture of (\( E \))-dimethyl(phenyl)(1-phenylprop-1-en-2-yl)silane (6) and (\( E \))-dimethyl(phenyl)(1-phenylprop-1-en-1-yl)silane (6’)

X-ray crystallographic analyses
Crystals suitable for the X-ray structural determination were mounted on a Bruker SMART APEXII CCD diffractometer and irradiated with graphite monochromated Mo Kα radiation (λ = 0.71073 Å) for data collection. The data were processed using the APEX3 program suite and summarized in a table shown in next page. All structures were solved by an intrinsic phasing method using the SHELXT program (ver. 2014/4–2014/5). Refinement on $F^2$ was carried out using full-matrix least-squares with the SHELXL and expanded using Fourier techniques. All nonhydrogen atoms, except those of disordered solvents, were refined using anisotropic thermal parameters. Hydrogen atoms were assigned to idealized geometric positions and included in structure factor calculations. The SHELX was interfaced with SHELXL GUI for most of the refinement steps. The pictures of the molecules were prepared using Pov-Ray 3.6.
