## Experimental Details

## General

All manipulations were carried out under an inert atmosphere of dry nitrogen using Schlenk techniques, or in an MBraun UniLab glovebox operating under an atmosphere of dry nitrogen with $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{O}_{2}<0.1 \mathrm{ppm}$. All glassware was silylated and dried either by overnight storage in an oven at $200{ }^{\circ} \mathrm{C}$ or by flame-drying under $10^{-3} \mathrm{~mm} \mathrm{Hg}$ vacuum. Solvents were dried by passage through activated alumina towers and degassed prior to use. All solvents were stored over potassium mirrors, except for ethers that were stored over activated $4 \AA$ molecular sieves. Deuterated solvent was distilled from $\mathrm{NaK}_{2}$, degassed by three freeze-pump-thaw cycles and stored under nitrogen.

Crystals were examined using an Agilent Supernova diffractometer, equipped with an Atlas CCD area detector and mirror-monochromated $\mathrm{Cu} \mathrm{K} \alpha$ radiation $(\lambda=1.5418 \AA$ ). Intensities were integrated from a sphere of data recorded on narrow $\left(1.0^{\circ}\right)$ frames by $\omega$ rotation. Cell parameters were refined from
the observed positions of all strong reflections in each data set. Gaussian grid face-indexed absorption corrections with a beam profile correction were applied. ${ }^{1}$ The structures were solved by direct methods using ShelXS, ${ }^{2}$ and all non-hydrogen atoms were refined by full-matrix least-squares on all unique $\mathrm{F}^{2}$ values with anisotropic displacement parameters with exceptions noted in the respective cif files. Except where noted, Hydrogen atoms were refined with constrained geometries and riding thermal parameters. The $\mathrm{N}-\mathrm{H}$ atom in $\mathbf{5}$ was located in the Fourier difference map. CrysAlisPro ${ }^{3}$ was used for control and integration, and SHELXL ${ }^{4}$ and Olex $2^{5}$ were employed for structure refinement. ORTEP$3^{6}$ and POV-Ray ${ }^{7}$ were employed for molecular graphics. FTIR spectra were recorded on a Bruker Alpha spectrometer with a Platinum-ATR module in the glovebox. Static variable-temperature magnetic moment data were recorded in an applied DC field of 0.5 T on a Quantum Design MPMS3 XL7 superconducting quantum interference device (SQUID) using recrystallised powdered samples. Samples were carefully checked for purity and data reproducibility between independently prepared batches for each compound examined. Care was taken to ensure complete thermalisation of the sample before each data point was measured, and samples were immobilised in an eicosane matrix to prevent sample reorientation during measurements. Diamagnetic corrections were applied using tabulated Pascal constants and measurements were corrected for the effect of the blank sample holders (flame sealed Wilmad NMR tube and straw) and eicosane matrix. Elemental microanalyses were carried out by Mr Martin Jennings at the Micro Analytical Laboratory, School of Chemistry, University of Manchester.

The compounds $\left[\left(\operatorname{Tren}^{\mathrm{TIPS}}\right) \mathrm{U}\left(\mathrm{N}_{3}\right)\right](\mathbf{1})$ and $\left[\left\{\left(\operatorname{Tren}^{\mathrm{TIPS}}\right) \mathrm{UNLi}\right\}_{2}\right]$ (4) were prepared as described previously. ${ }^{8,9}$ Alkali metals were washed with hexane to remove any protective mineral oil coatings and were stored under argon. The lithium powder was then used directly but other alkali metals were freshly cut and freed of any passivated oxide layer before use.

## Preparation of $\left[\left\{\left(\text { Tren }^{\text {TIPS }}\right) \mathbf{U N}\right\}_{2} \mathrm{Li}_{4}\right]$ (2)

Method A: A solution of $\mathbf{1}(3.57 \mathrm{~g}, 4.00 \mathrm{mmol})$ in toluene $(10 \mathrm{ml})$ was added to a cold $\left(-78^{\circ} \mathrm{C}\right)$ slurry of Li metal $(0.20 \mathrm{~g}, 28.57 \mathrm{mmol})$ in toluene $(20 \mathrm{ml})$. The mixture was allowed to slowly warm to room temperature and was then stirred for 5 days. Each day the mixture was sonicated for 1 hr . After this time the mixture turned dark blue/red and a red precipitate had formed. The red precipitate was isolated by filtration (via cannula), then extracted into boiling toluene ( 60 ml ) and filtered through a frit. The residue was washed with boiling toluene $(2 \times 10 \mathrm{ml})$ and filtered. The combined filtrate was concentrated to $\sim 30 \mathrm{ml}$ and stored at $-30^{\circ} \mathrm{C}$ to yield 2 as a red crystalline solid. The product was isolated by filtration, washed with pentane ( $2 \times 10 \mathrm{ml}$ ) and dried in vacuo. Method B: A solution of 4 $(3.48 \mathrm{~g}, 2.00 \mathrm{mmol})$ in toluene $(10 \mathrm{ml})$ was added to a cold $\left(-78^{\circ} \mathrm{C}\right)$ slurry of Li metal $(0.04 \mathrm{~g}, 5.8$ $\mathrm{mmol})$ in toluene ( 20 ml ). The mixture was allowed to slowly to warm to room temperature and was then stirred for 5 days. Each day the mixture was sonicated for 1 hr . The resulting red precipitate was extracted into boiling toluene $(60 \mathrm{ml})$ and filtered through a frit. The residue was washed with boiling toluene ( $2 \times 10 \mathrm{ml}$ ) and filtered. The combined filtrate was stored at $-30^{\circ} \mathrm{C}$ to yield $\mathbf{2}$ as a red crystalline solid. The product was isolated by filtration, washed with pentane $(2 \times 10 \mathrm{ml})$ and dried in vacuo. Representative yield of either method: $2.05 \mathrm{~g}, 58 \%$. Anal. calcd for $\mathrm{C}_{66} \mathrm{H}_{150} \mathrm{~N}_{10} \mathrm{Li}_{4} \mathrm{Si}_{6} \mathrm{U}_{2}$ : C, 45.14; H, 8.61; N, 7.97\%. Found: C, 45.45; H, 8.57; N, 7.88\%. FTIR $v / \mathrm{cm}^{-1}$ (Nujol): 1631 (w), 1377 (w), 1300 (w), 1261 (w), 1052 (bs), 1025 (s), 990 (w), 933 ( s), $917(\mathrm{~m}), 882$ ( s$), 738$ ( s$), 671$ (m), 620 (m), $564(\mathrm{w}), 513(\mathrm{w})$. Once obtained in crystalline form, $\mathbf{2}$ is insoluble in aromatic solvents and it decomposes in polar solvents so ${ }^{1} \mathrm{H}$ and ${ }^{29} \mathrm{Si}$ NMR and UV/Vis/NIR spectra could not be obtained.

## Preparation of $\left[\left\{\left(\text { Tren }^{\text {TIPS }}\right) \mathbf{U N}\right\}_{2} \mathrm{HLi}_{3}\right]$ (5)

Method A: Toluene ( 15 ml ) was added to a mixture of $\mathbf{2}(0.44 \mathrm{~g}, 0.25 \mathrm{mmol})$ and benzo-9-crown-3 $(0.18 \mathrm{~g}, 1 \mathrm{mmol})$. The resulting red mixture was gently heated to dissolve both reagents, then filtered and the volume was reduced to ca. 5 ml . Storage of the mixture at $-30^{\circ} \mathrm{C}$ afforded red crystals of 5 . Yield: $0.06 \mathrm{~g}, 13 \%$. Method B: Toluene $(10 \mathrm{ml})$ was added to a pre-cooled $\left(-78^{\circ} \mathrm{C}\right)$ mixture of $2(0.20$
$\mathrm{g}, 0.11 \mathrm{mmol})$ and $\mathrm{AgBPh}_{4}(0.048 \mathrm{~g}, 0.11 \mathrm{mmol})$. The resulting red suspension was allowed to warm to room temperature, sonicated for 1 hr , then stirred for 72 hrs . Volatiles were removed in vacuo and the resulting red solid was recrystallised from hot toluene ( 2 ml ) to afford red crystals of $\mathbf{5}$ on storing at room temperature. Yield: $0.11 \mathrm{~g}, 53 \%$. Anal. Calcd for $\mathrm{C}_{66} \mathrm{H}_{151} \mathrm{Li}_{3} \mathrm{~N}_{10} \mathrm{Si}_{6} \mathrm{U}_{2}$ : C, 45.29; H, 8.69; N, $8.00 \%$. Found: C, $45.34 ;$ H, 8.67 ; N, $7.88 \%$. FTIR $v / \mathrm{cm}^{-1}$ (ATR): 3395 (br), 2937 (m), 2855 (s), 2830 (m), 1494 (w), 1456 (m), 1241 ( s), 1185 (w), 1074 (m), 1065 (m), 988 (s), 915 (s), 881 (s), 816 (m), $778(\mathrm{~m}), 737(\mathrm{~s}), 670(\mathrm{~m}), 572(\mathrm{~s}), 514(\mathrm{w}), 493(\mathrm{~m}), 414(\mathrm{w})$. Once obtained in crystalline form, 5 is insoluble in aromatic solvents and it decomposes in polar solvents so ${ }^{1} \mathrm{H}$ and ${ }^{29} \mathrm{Si} \mathrm{NMR}$ and UV/Vis/NIR spectra could not be obtained.

## Representative attempted double reductions of 1 with excess $\mathbf{N a - C s}$ or $\mathrm{MC}_{8}(\mathrm{M}=\mathbf{K}-\mathrm{Cs})$

In a typical procedure, toluene $(20 \mathrm{ml})$ was added to a precooled $\left(-78^{\circ} \mathrm{C}\right)$ mixture of $\mathbf{1}(0.45 \mathrm{~g}$, $0.50 \mathrm{mmol})$ and the respective reductant ( 2.00 mmol ). The resulting mixture was allowed to warm to ambient temperature and stirred for 24 hrs , during which time it was sonicated three times ( 1 hr each time) before being stirred for another 24 hrs. Hot filtration then cooling afforded crystalline 4M (typically in $\sim 55 \%$ yield). Extended reaction times resulted in overall decomposition to $\operatorname{Tren}^{\text {TIPS }} \mathrm{H}_{3}$ and other unidentified species.

Representative attempted double reductions of 1 with stoichiometric $\mathbf{N a - C s}$ or $\mathbf{M C}_{8}(\mathbf{M}=\mathbf{K}-$ Cs)

In a typical procedure, toluene $(20 \mathrm{ml})$ was added to a precooled $\left(-78^{\circ} \mathrm{C}\right)$ mixture of $\mathbf{1}(0.45 \mathrm{~g}$, $0.50 \mathrm{mmol})$ and the respective reductant ( 1.00 mmol ). The resulting mixture was allowed to warm to ambient temperature and stirred for 24 hrs , during which time it was sonicated three times ( 1 hr each time) before being stirred for another 24 hrs. Hot filtration then cooling afforded crystalline 4M (typically in $45 \%$ yield). Extended reaction times resulted in overall decomposition to Tren ${ }^{\text {TIPS }} \mathrm{H}_{3}$ and other unidentified species.

## Representative attempted reductions of $4 \mathrm{M}(\mathrm{M}=\mathbf{N a}-\mathrm{Cs})$ using excess $\mathbf{N a - C s}$ or $\mathrm{MC}_{8}(\mathbf{M}=\mathbf{K}$ -

 Cs)In a typical procedure, toluene $(20 \mathrm{ml})$ was added to a precooled $\left(-78^{\circ} \mathrm{C}\right)$ mixture of $\mathbf{4 M}(0.50 \mathrm{mmol})$ and the respective reductant ( 2.00 mmol ). The resulting mixture was allowed to warm to ambient temperature and stirred for 24 hrs , during which time it was sonicated three times ( 1 hr each time) before being stirred for another 24 hrs . Hot filtration then cooling afforded crystalline 4 M (typically in $40 \%$ yield). Extended reaction times resulted in overall decomposition to $\mathrm{Tren}^{\text {TIPS }} \mathrm{H}_{3}$ and other unidentified species.

## Computational Details

DFT calculations on $\mathbf{4}$ were performed with Gaussian 16 revision A. $03,{ }^{10}$ and with Turbomole 7.3 for 3. ${ }^{11}$ Calculations were spin unrestricted and used the GGA functional PBE, ${ }^{12}$ as well as the hybrid PBE0. ${ }^{13}$ The $60 \mathrm{e}^{-}$relativistic effective core potential (RECP) of the Stuttgart/Cologne group (ECP60MWB) was used alongside the associated segmented basis set, ${ }^{14-16}$ and on other elements the cc-pVDZ basis set was used. ${ }^{17-19}$ Grimme's D3 dampening function was used to account for dispersion interactions. ${ }^{20}$ Integration grids and convergence criteria were left at their default in Gaussian 16, and in Turbomole the m 4 integration grid was used, with convergence criteria being left at their default. CASSCF and RASSCF calculations were performed on model systems using OpenMolcas $18.09^{21}$ Calculations were performed in $\mathrm{C}_{\mathrm{i}}$ symmetry, reflecting the symmetry of the XRD crystal structure. The ANO-RCC basis set was used; on uranium, and the ring nitrogen atoms, the VTZP contraction was used and VDZ on all other atoms. The second-order Douglas-Kroll-Hess Hamiltonian was used to account for scalar relativistic effects. Cholesky decomposition was used, with the high decomposition threshold. CASPT2 and MS-CASPT2 calculations used an imaginary shift of 0.2 in addition to the default IPEA shift of 0.25 . Mulliken composition of the active natural orbitals was analysed with Molpy. ${ }^{22}$ Quantum Theory of Atoms-in-Molecules (QTAIM) ${ }^{23}$ analyses were performed with AIMALL, ${ }^{24}$ Natural Bond Orbital (NBO) analyses were performed with NBO 6.0. ${ }^{25}$

## Magnetic Data

Figure S1. Variable-temperature magnetic data of a powdered sample of 2. a) $\mu_{\text {eff }}$ vs T, b) $\chi \mathrm{T}$ vs T, c) $\chi$ vs T, d) $\chi^{-1}$ vs T. The lines represent the modelled magnetic susceptibility from PHI.

Figure S2. Variable-temperature magnetic data of a powdered sample of 5. a) $\mu_{\text {eff }}$ vs T, b) $\chi \mathrm{T}$ vs T, c) $\chi$ vs T, d) $\chi^{-1}$ vs T. The lines represent the modelled magnetic susceptibility from PHI.
